The Civis API Python client is a Python package that helps analysts and developers interact with the Civis Platform. The package includes a set of tools around common workflows as well as a convenient interface to make requests directly to the Civis API.

Contents 1

2 Contents

## CHAPTER 1

## **API Keys**

In order to make requests to the Civis API, you will need a Civis Platform API key that is unique to you. Instructions for creating a new key are found here. API keys have a set expiration date and new keys will need to be created at least every 30 days. The API client will look for a CIVIS\_API\_KEY environmental variable to access your API key, so after creating a new API key, follow the steps below for your operating system to set up your environment.

## 1.1 Linux / MacOS

1. Add the following to .bash\_profile (or .bashrc for Linux) for bash:

```
export CIVIS_API_KEY="alphaNumericApiK3y"
```

2. Source your .bash\_profile (or restart your terminal).

## **1.2 Windows 10**

- 1. Navigate to "Settings" -> type "environment" in search bar -> "Edit environment variables for your account". This can also be found in "System Properties" -> "Advanced" -> "Environment Variables...".
- 2. In the user variables section, if CIVIS\_API\_KEY already exists in the list of environment variables, click on it and press "Edit...". Otherwise, click "New.".
- 3. Enter CIVIS\_API\_KEY as the "Variable name".
- 4. Enter your API key as the "Variable value". Your API key should look like a long string of letters and numbers.

# CHAPTER 2

Installation

After creating an API key and setting the CIVIS\_API\_KEY environmental variable, install the Python package civis with the recommended method via pip:

```
pip install civis
```

Alternatively, if you are interested in the latest functionality not yet released through pip, you may clone the code from GitHub and build from source:

```
git clone https://github.com/civisanalytics/civis-python.git
cd civis-python
python setup.py install
```

You can test your installation by running

```
import civis
client = civis.APIClient()
print(client.users.list_me()['username'])
```

If civis was installed correctly, this will print your Civis Platform username.

The client has a soft dependency on pandas to support features such as data type parsing. If you are using the io namespace to read or write data from Civis, it is highly recommended that you install pandas and set use\_pandas=True in functions that accept that parameter. To install pandas:

```
pip install pandas
```

Machine learning features in the ml namespace have a soft dependency on scikit-learn and pandas. Install scikit-learn to export your trained models from the Civis Platform or to provide your own custom models. Use pandas to download model predictions from the Civis Platform. The civis.ml code optionally uses the feather format to transfer data from your local computer to Civis Platform. Install these dependencies with

```
pip install scikit-learn
pip install pandas
pip install feather-format
```

Some CivisML models have open-source dependencies in addition to scikit-learn, which you may need if you want to download the model object. These dependencies are civisml-extensions, glmnet, and muffnn. Install these dependencies with

```
pip install civisml-extensions
pip install glmnet
pip install muffnn
```

# CHAPTER 3

Python version support

Python 2.7, 3.4, 3.5, 3.6, and 3.7

User Guide

For a more detailed walkthrough, see the *User Guide*.

# CHAPTER 5

## Retries

The API client will automatically retry for certain API error responses.

If the error is one of [413, 429, 503] and the API client is told how long it needs to wait before it's safe to retry (this is always the case with 429s, which are rate limit errors), then the client will wait the specified amount of time before retrying the request.

If the error is one of [429, 502, 503, 504] and the request is not a patch\* or post\* method, then the API client will retry the request several times, with a delay, to see if it will succeed.

12 Chapter 5. Retries

# CHAPTER 6

Client API Reference

### 6.1 User Guide

## 6.1.1 Getting Started

After installing the Civis API Python client and setting up your API key, you can now import the package civis:

```
>>> import civis
```

There are two entrypoints for working with the Civis API. The first is the civis namespace, which contains tools for typical workflows in a user friendly manner. For example, you may want to perform some transformation on your data in Python that might be tricky to code in SQL. This code downloads data from Civis, calculates the correlation between all the columns and then uploads the data back into Civis:

#### 6.1.2 Civis Futures

In the code above, <code>dataframe\_to\_civis()</code> returns a special <code>CivisFuture</code> object. Making a request to the Civis API usually results in a long running job. To account for this, various functions in the <code>civis</code> namespace return a <code>CivisFuture</code> to allow you to process multiple long running jobs simultaneously. For instance, you may want to start many jobs in parallel and wait for them all to finish rather than wait for each job to finish before starting the next one.

The <code>CivisFuture</code> follows the <code>concurrent.futures.Future</code> API fairly closely. For example, calling <code>result()</code> on <code>fut</code> above forces the program to wait for the job started with <code>dataframe\_to\_civis()</code> to finish and returns the result.

You can create CivisFuture objects for many tasks (e.g., scripts, imports). Here, we will create a container script that does the simple task of printing the text "HELLO WORLD", execute it, and then wait for it to finish.

```
>>> import civis
>>> import concurrent.futures
>>>
>>> client = civis.APIClient()
>>>
>>> # Create a container script. This is just a simple example. Futures can
>>> # also be used with SQL queries, imports, etc.
>>> response_script = client.scripts.post_containers(
       required_resources={'cpu': 512, 'memory': 1024},
       docker_command="echo 'HELLO WORLD'",
       docker_image_name='civisanalytics/datascience-python')
>>> script_id = response_script.id
>>> # Create a run in order to execute the script.
>>> response_run = client.scripts.post_containers_runs(script_id)
>>> run_id = response_run.id
>>> # Create a future to represent the result of the run.
>>> future = civis.futures.CivisFuture(
       client.scripts.get_containers_runs, (script_id, run_id))
. . .
>>> # You can then have your code block and wait for the future to be done as
>>> # follows.
>>> concurrent.futures.wait([future])
>>>
>>> # Alternatively, you can call `future.result()` to block and get the
>>> # status of the run once it finishes. If the run is already completed, the
>>> # result will be returned immediately.
>>> result = future.result()
>>>
>>> # Alternatively, one can start a run and get a future for it with the helper
>>> # function `civis.utils.run_job`:
>>> future2 = civis.utils.run_job(script_id)
>>> future2.result()
```

## 6.1.3 Working Directly with the Client

Although many common workflows are included in the Civis API Python client, projects often require direct calls to the Civis API. For convenience, the Civis API Python client implements an <code>APIClient</code> object to make these API calls with Python syntax rather than a manually crafted HTTP request. To make a call, first instantiate an <code>APIClient</code> object:

```
>>> client = civis.APIClient()
```

**Note:** Creating an instance of APIClient makes an HTTP request to determine the functions to attach to the object. You must have an API key and internet connection to create an APIClient object.

With the client object instantiated, you can now make API requests like listing your user information:

Suppose we did not have the civis.io namespace. This is how we might export a CSV file from Civis. As you will see, this can be quite involved and the civis namespace entrypoint should be preferred whenever possible.

First, we get the ID for our database then we get the default credential for the current user.

```
>>> db_id = client.get_database_id('cluster-name')
>>> cred_id = client.default_credential
```

In order to export a table, we need to write some SQL that will generate the data to export. Then we create the export job and run it.

We can then poll and wait for the export to be completed.

Now, we can get the URL of the exported csv. First, we grab the result of our export job.

In the future, a script may export multiple jobs, so the output of this is a list.

The path returned will have a gzipped csv file, which we could load, for example, with pandas.

```
>>> url = export_result.output[0].path
```

## **6.1.4 API Response Types and Functions**

Many API requests via an APIClient instance return an iterable of civis.response.Response objects. For endpoints that support pagination when the *iterator* kwarg is specified, a civis.response. PaginatedResponse object is returned. To facilitate working with civis.response.Response objects, the helper functions civis.find() and civis.find\_one() are defined.

6.1. User Guide 15

## 6.2 Data Import and Export

The civis. io namespace provides several functions for moving data in and out of Civis.

#### 6.2.1 Tables

Often, your data will be in structured format like a table in a relational database, a CSV or a dataframe. The following functions handle moving structured data to and from Civis. When using these functions, it is recommended to have *pandas* installed and to pass *use\_pandas=True* in the appropriate functions. If *pandas* is not installed, data returned from Civis will all be treated as strings.

civis_to_csv(filename, sql, database[,])	Export data from Civis to a local CSV file.
<pre>civis_to_multifile_csv(sql, database[,])</pre>	Unload the result of SQL query and return presigned
	urls.
civis_file_to_table(file_id, database, table)	Upload the contents of a Civis file to a Civis table.
csv_to_civis(filename, database, table[,])	Upload the contents of a local CSV file to Civis.
dataframe_to_civis(df, database, table[,])	Upload a pandas DataFrame into a Civis table.
read_civis(table, database[, columns,])	Read data from a Civis table.
read_civis_sql(sql, database[, use_pandas,])	Read data from Civis using a custom SQL string.
<pre>export_to_civis_file(sql, database[,])</pre>	Store results of a query to a Civis file

#### civis.io.civis to csv

civis.io.civis\_to\_csv (filename, sql, database, job\_name=None, api\_key=None, client=None, credential\_id=None, include\_header=True, compression='none', delimiter=', ', unquoted=False, archive=False, hidden=True, polling\_interval=None) Export data from Civis to a local CSV file.

The custom SQL string will be executed twice; once to attempt to retrieve headers and once to retrieve the data. This is done to use a more performant method for retrieving the data. The first execution of the custom SQL is controlled such that changes in state cannot occur (e.g., INSERT, UPDATE, DELETE, etc.).

#### **Parameters**

**filename** [str] Download exported data into this file.

**sql** [str, optional] The SQL select string to be executed.

database [str or int] Export data from this database. Can be the database name or ID.

job\_name [str, optional] A name to give the job. If omitted, a random job name will be used.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS API KEY environment variable will be used.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

**credential\_id** [str or int, optional] The ID of the database credential. If None, the default credential will be used.

**include\_header: bool, optional** If True, the first line of the CSV will be headers. Default: True.

**compression:** str, optional Type of compression to use, if any. One of 'none', 'zip', or 'gzip'. Default 'none'. 'gzip' currently returns a file with no compression unless in-

clude\_header is set to False. In a future release, a 'gzip' compressed file will be returned for all cases.

**delimiter: str, optional** Which delimiter to use, if any. One of ',',' ', or '|'. Default: ','.

unquoted: bool, optional Whether or not to quote fields. Default: False.

**polling\_interval** [int or float, optional] Number of seconds to wait between checks for query completion.

archive [bool, optional (deprecated)] If True, archive the import job as soon as it completes.

hidden [bool, optional] If True (the default), this job will not appear in the Civis UI.

#### Returns

results [CivisFuture] A CivisFuture object.

#### See also:

```
civis.io.read_civis Read table contents into memory.
civis.io.read_civis_sql Read results of a SQL query into memory.
civis.io.export_to_civis_file Store a SQL query's results in a Civis file
```

#### **Examples**

```
>>> sql = "SELECT * FROM schema.table"
>>> fut = civis_to_csv("file.csv", sql, "my_database")
>>> fut.result() # Wait for job to complete
```

#### civis.io.civis\_to\_multifile\_csv

```
civis.io.civis_to_multifile_csv(sql, database, job_name=None, api_key=None, client=None, credential_id=None, include_header=True, compression='none', delimiter='\', unquoted=False, prefix=None, polling_interval=None, hidden=True)
```

Unload the result of SQL query and return presigned urls.

This function is intended for unloading large queries/tables from redshift as it uses a 'PARALLEL ON' S3 unload. It returns a similar manifest file to conventional S3 UNLOAD statements except the CSV parts are accessible via both files endpoint IDs and presigned S3 urls.

#### **Parameters**

**sql** [str, optional] The SQL select string to be executed.

database [str or int] Execute the query against this database. Can be the database name or ID.

job\_name [str, optional] A name to give the job. If omitted, a random job name will be used.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS\_API\_KEY environment variable will be used.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

credential\_id [str or int, optional] The database credential ID. If None, the default credential
will be used.

```
include_header: bool, optional If True include a key in the returned dictionary containing a list of column names. Default: True.
```

```
compression: str, optional Type of compression to use, if any. One of 'none', 'zip', or 'gzip'. Default 'none'.
```

```
delimiter: str, optional Which delimiter to use, if any. One of ',',' ', or '|'. Default: '|'.
```

unquoted: bool, optional Whether or not to quote fields. Default: False.

prefix: str, optional A user specified filename prefix for the output file to have. Default: None.

**polling\_interval** [int or float, optional] Number of seconds to wait between checks for query completion.

hidden [bool, optional] If True (the default), this job will not appear in the Civis UI.

#### Returns

```
unload_manifest: dict A dictionary resembling an AWS manifest file. Has the following keys:
    'query': str The query.
    'header': list of str The columns from the query.
    'entries': list of dict Each dict has the following keys:
        'id': int File ID
        'name': str Filename
        'size': int File size in bytes
        'url': str Unsigned S3 URL ('s3://...')
        'url_signed': str Signed S3 URL ('https://...')
        'unquoted': bool Whether the cells are quoted.
        'compression': str Type of compression used.
        'delimiter': str Delimiter that separates the cells.
```

#### See also:

```
civis.APIClient.scripts.post_sql
```

#### **Examples**

```
>>> sql = "SELECT * FROM schema.my_big_table"
>>> database = "my_database"
>>> delimiter = "|"
>>> manifest = civis_to_multifile_csv(sql, database, delimiter=delimiter)
>>> ids = [entry['id'] for entry in manifest['entries']]
>>> buf = BytesIO()
>>> civis_to_file(ids[0], buf)
>>> buf.seek(0)
>>> df = pd.read_csv(buf, delimiter=delimiter)
```

#### civis.io.civis file to table

```
civis.io.civis_file_to_table (file_id, database, table, client=None, max_errors=None, existing_table_rows='fail', diststyle=None, distkey=None, sortkey1=None, sortkey2=None, delimiter=', ', headers=None, credential_id=None, polling_interval=None, hidden=True)

Upload the contents of a Civis file to a Civis table.
```

#### **Parameters**

```
file_id [int] Civis file ID.
```

database [str or int] Upload data into this database. Can be the database name or ID.

table [str] The schema and table you want to upload to. E.g., 'scratch.table'.

client [civis.APIClient, optional] If not provided, an civis.APIClient object will
be created from the CIVIS API KEY.

**max\_errors** [int, optional] The maximum number of rows with errors to remove from the import before failing.

existing\_table\_rows [str, optional] The behaviour if a table with the requested name already exists. One of 'fail', 'truncate', 'append' or 'drop'. Defaults to 'fail'.

**diststyle** [str, optional] The distribution style for the table. One of 'even', 'all' or 'key'.

distkey [str, optional] The column to use as the distkey for the table.

**sortkey1** [str, optional] The column to use as the sortkey for the table.

sortkey2 [str, optional] The second column in a compound sortkey for the table.

**delimiter** [string, optional] The column delimiter. One of ', ', '\t' or '|'.

**headers** [bool, optional] Whether or not the first row of the file should be treated as headers. The default, None, attempts to autodetect whether or not the first row contains headers.

**credential\_id** [str or int, optional] The ID of the database credential. If None, the default credential will be used.

**polling\_interval** [int or float, optional] Number of seconds to wait between checks for job completion.

hidden [bool, optional] If True (the default), this job will not appear in the Civis UI.

#### Returns

results [CivisFuture] A CivisFuture object.

#### **Examples**

#### civis.io.csv to civis

civis.io.csv\_to\_civis (filename, database, table, api\_key=None, client=None, max\_errors=None, existing\_table\_rows='fail', diststyle=None, distkey=None, sortkey1=None, sortkey2=None, delimiter=', ', headers=None, credential\_id=None, polling\_interval=None, archive=False, hidden=True)

Upload the contents of a local CSV file to Civis.

#### **Parameters**

**filename** [str] Upload the contents of this file.

database [str or int] Upload data into this database. Can be the database name or ID.

table [str] The schema and table you want to upload to. E.g., 'scratch.table'.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS\_API\_KEY environment variable will be used.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

**max\_errors** [int, optional] The maximum number of rows with errors to remove from the import before failing.

existing\_table\_rows [str, optional] The behaviour if a table with the requested name already exists. One of 'fail', 'truncate', 'append' or 'drop'. Defaults to 'fail'.

diststyle [str, optional] The distribution style for the table. One of 'even', 'all' or 'key'.

distkey [str, optional] The column to use as the distkey for the table.

**sortkey1** [str, optional] The column to use as the sortkey for the table.

sortkey2 [str, optional] The second column in a compound sortkey for the table.

**delimiter** [string, optional] The column delimiter. One of ', ', '\t' or '|'.

**headers** [bool, optional] Whether or not the first row of the file should be treated as headers. The default, None, attempts to autodetect whether or not the first row contains headers.

credential\_id [str or int, optional] The ID of the database credential. If None, the default credential will be used.

**polling\_interval** [int or float, optional] Number of seconds to wait between checks for job completion.

archive [bool, optional (deprecated)] If True, archive the import job as soon as it completes.

hidden [bool, optional] If True (the default), this job will not appear in the Civis UI.

#### Returns

results [CivisFuture] A CivisFuture object.

#### **Notes**

This reads the contents of *filename* into memory.

#### **Examples**

#### civis.io.dataframe to civis

```
civis.io.dataframe_to_civis (df, database, table, api_key=None, client=None, max_errors=None, existing_table_rows='fail', diststyle=None, distkey=None, sortkey1=None, sortkey2=None, headers=None, credential_id=None, polling_interval=None, archive=False, hidden=True, **kwargs)
```

Upload a *pandas DataFrame* into a Civis table.

The *DataFrame*'s index will not be included. To store the index along with the other values, use *df.reset\_index()* instead of *df* as the first argument to this function.

#### **Parameters**

df [pandas.DataFrame] The DataFrame to upload to Civis.

database [str or int] Upload data into this database. Can be the database name or ID.

table [str] The schema and table you want to upload to. E.g., 'scratch.table'. Schemas or tablenames with periods must be double quoted, e.g. 'scratch."my.table"'.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS\_API\_KEY environment variable will be used.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

**max\_errors** [int, optional] The maximum number of rows with errors to remove from the import before failing.

existing\_table\_rows [str, optional] The behaviour if a table with the requested name already exists. One of 'fail', 'truncate', 'append' or 'drop'. Defaults to 'fail'.

**diststyle** [str, optional] The distribution style for the table. One of 'even', 'all' or 'key'.

**distkey** [str, optional] The column to use as the distkey for the table.

sortkey1 [str, optional] The column to use as the sortkey for the table.

sortkey2 [str, optional] The second column in a compound sortkey for the table.

**headers** [bool, optional] Whether or not the first row of the file should be treated as headers. The default, None, attempts to autodetect whether or not the first row contains headers.

credential\_id [str or int, optional] The ID of the database credential. If None, the default credential will be used.

**polling\_interval** [int or float, optional] Number of seconds to wait between checks for job completion.

**archive** [bool, optional (deprecated)] If True, archive the import job as soon as it completes.

**hidden** [bool, optional] If True (the default), this job will not appear in the Civis UI.

\*\*kwargs [kwargs] Extra keyword arguments will be passed to pandas.DataFrame. to\_csv().

#### Returns

fut [CivisFuture] A CivisFuture object.

#### **Examples**

#### civis.io.read civis

civis.io.read\_civis (table, database, columns=None, use\_pandas=False, job\_name=None, api\_key=None, client=None, credential\_id=None, polling\_interval=None, archive=False, hidden=True, \*\*kwargs)

Read data from a Civis table.

#### **Parameters**

table [str] Name of table, including schema, in the database. E.g. 'my\_schema.
my\_table'. Schemas or tablenames with periods must be double quoted, e.g.
'my\_schema."my.table"'.

database [str or int] Read data from this database. Can be the database name or ID.

**columns** [list, optional] A list of column names. Column SQL transformations are possible. If omitted, all columns are exported.

use\_pandas [bool, optional] If True, return a pandas.DataFrame. Otherwise, return a list
 of results from csv.reader().

**job\_name** [str, optional] A name to give the job. If omitted, a random job name will be used.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS API KEY environment variable will be used.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

**credential\_id** [str or int, optional] The database credential ID. If None, the default credential will be used.

**polling\_interval** [int or float, optional] Number of seconds to wait between checks for query completion.

archive [bool, optional (deprecated)] If True, archive the import job as soon as it completes.

hidden [bool, optional] If True (the default), this job will not appear in the Civis UI.

\*\*kwargs [kwargs] Extra keyword arguments are passed into pandas.read\_csv() if use\_pandas is True or passed into csv.reader() if use\_pandas is False.

#### Returns

data [pandas.DataFrame or list] A list of rows (with header as first row) if *use\_pandas* is False, otherwise a *pandas DataFrame*. Note that if *use\_pandas* is False, no parsing of types is performed and each row will be a list of strings.

#### Raises

**ImportError** If *use\_pandas* is True and *pandas* is not installed.

#### See also:

```
civis.io.read_civis_sql Read directly into memory using SQL.
civis.io.civis_to_csv Write directly to csv.
civis.io.export_to_civis_file Store a SQL query's results in a Civis file
```

#### **Examples**

```
>>> table = "schema.table"
>>> database = "my_data"
>>> columns = ["column_a", "ROW_NUMBER() OVER(ORDER BY date) AS order"]
>>> data = read_civis(table, database, columns=columns)
>>> columns = data.pop(0)
>>> col_a_index = columns.index("column_a")
>>> col_a = [row[col_a_index] for row in data]
```

```
>>> df = read_civis("schema.table", "my_data", use_pandas=True)
>>> col_a = df["column_a"]
```

#### civis.io.read\_civis\_sql

civis.io.read\_civis\_sql(sql, database, use\_pandas=False, job\_name=None, api\_key=None, client=None, credential\_id=None, polling\_interval=None, archive=False, hidden=True, \*\*kwargs)

Read data from Civis using a custom SQL string.

The custom SQL string will be executed twice; once to attempt to retrieve headers and once to retrieve the data. This is done to use a more performant method for retrieving the data. The first execution of the custom SQL is controlled such that changes in state cannot occur (e.g., INSERT, UPDATE, DELETE, etc.).

#### **Parameters**

**sql** [str, optional] The SQL select string to be executed.

database [str or int] Execute the query against this database. Can be the database name or ID.

use\_pandas [bool, optional] If True, return a pandas.DataFrame. Otherwise, return a list
 of results from csv.reader().

job\_name [str, optional] A name to give the job. If omitted, a random job name will be used.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS API KEY environment variable will be used.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

credential\_id [str or int, optional] The database credential ID. If None, the default credential will be used.

**polling\_interval** [int or float, optional] Number of seconds to wait between checks for query completion.

**archive** [bool, optional (deprecated)] If True, archive the import job as soon as it completes.

hidden [bool, optional] If True (the default), this job will not appear in the Civis UI.

\*\*kwargs [kwargs] Extra keyword arguments are passed into pandas.read\_csv() if use\_pandas is True or passed into csv.reader() if use\_pandas is False.

#### Returns

**data** [pandas.DataFrame or list] A list of rows (with header as first row) if *use\_pandas* is False, otherwise a *pandas DataFrame*. Note that if *use\_pandas* is False, no parsing of types is performed and each row will be a list of strings.

#### Raises

ImportError If use\_pandas is True and pandas is not installed.

#### See also:

```
civis.io.read_civis Read directly into memory without SQL.
civis.io.civis_to_csv Write directly to a CSV file.
```

#### **Notes**

This reads the data into memory.

#### **Examples**

```
>>> sql = "SELECT * FROM schema.table"
>>> df = read_civis_sql(sql, "my_database", use_pandas=True)
>>> col_a = df["column_a"]
```

```
>>> data = read_civis_sql(sql, "my_database")
>>> columns = data.pop(0)
>>> col_a_index = columns.index("column_a")
>>> col_a = [row[col_a_index] for row in data]
```

#### civis.io.export to civis file

```
\begin{tabular}{ll} {\tt civis.io.export\_to\_civis\_file} (sql, & database, & job\_name=None, & client=None, & credential\_id=None, & polling\_interval=None, & hidden=True, \\ & csv\_settings=None) \end{tabular}
```

Store results of a query to a Civis file

#### **Parameters**

**sql** [str, optional] The SQL select string to be executed.

database [str or int] Execute the query against this database. Can be the database name or ID.

**job\_name** [str, optional] A name to give the job. If omitted, a random job name will be used.

client [civis.APIClient, optional] If not provided, an civis.APIClient object will
be created from the CIVIS API KEY.

credential\_id [str or int, optional] The database credential ID. If None, the default credential
will be used.

**polling\_interval** [int or float, optional] Number of seconds to wait between checks for query completion.

hidden [bool, optional] If True (the default), this job will not appear in the Civis UI.

csv\_settings [dict, optional] A dictionary of csv\_settings to pass to civis.APIClient.
scripts.post\_sql().

#### Returns

fut [CivisFuture] A future which returns the response from civis.APIClient.
 scripts.get\_sql\_runs() after the sql query has completed and the result has been
 stored as a Civis file.

#### See also:

```
civis.io.read_civis Read directly into memory without SQL.
civis.io.read_civis_sql Read results of a SQL query into memory.
civis.io.civis_to_csv Write directly to a CSV file.
civis.io.civis_file_to_table Upload a Civis file to a Civis table
```

#### **Examples**

```
>>> sql = "SELECT * FROM schema.table"
>>> fut = export_to_civis_file(sql, "my_database")
>>> file_id = fut.result()['output'][0]["file_id"]
```

#### **6.2.2 Files**

These functions will pass flat files to and from Civis. This is useful if you have data stored in binary or JSON format. Any type of file can be stored in platform via the files endpoint.

civis_to_file(file_id, buf[, api_key, client])	Download a file from Civis.	
file_id_from_run_output(name, job_id,	Find the file ID of a File run output with the name	
run_id)	"name"	
<pre>file_to_civis(buf, name[, api_key, client])</pre>	Upload a file to Civis.	
file_to_dataframe(file_id[, compression,	Load a DataFrame from a CSV stored in a Civis File	
client])		
<pre>file_to_json(file_id[, client])</pre>	Restore JSON stored in a Civis File	

#### civis.io.civis to file

```
civis.io.civis_to_file (file_id, buf, api_key=None, client=None)

Download a file from Civis.
```

#### **Parameters**

file\_id [int] The Civis file ID.

buf [file-like object or str] A buffer or path specifying where to write the contents of the Civis

file. Strings will be treated as paths to local files to open.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS\_API\_KEY environment variable will be used.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

#### Returns

None

#### **Examples**

```
>>> file_id = 100
>>> # Download a file to a path on the local filesystem.
>>> civis_to_file(file_id, "my_file.txt")
>>> # Download a file to a file object.
>>> with open("my_file.txt", "wb") as f:
... civis_to_file(file_id, f)
>>> # Download a file as a bytes object.
>>> import io
>>> buf = io.BytesIO()
>>> civis_to_file(file_id, buf)
>>> # Note that s could be converted to a string with s.decode('utf-8').
>>> s = buf.read()
```

#### civis.io.file id from run output

```
civis.io.file_id_from_run_output (name, job_id, run_id, regex=False, client=None) Find the file ID of a File run output with the name "name"
```

The run output is required to have type "File". If using an approximate match and multiple names match the provided string, return only the first file ID.

#### **Parameters**

```
name [str] The "name" field of the run output you wish to retrieve
job_id [int]
run_id [int]
```

**regex** [bool, optional] If False (the default), require an exact string match between name and the name of the run output. If True, search for a name which matches the regular expression name and retrieve the first found.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

#### Returns

file id [int] The ID of a Civis File with name matching name

#### Raises

IOError If the provided job ID and run ID combination can't be found

FileNotFoundError If the run exists, but name isn't in its run outputs

#### See also:

```
APIClient.scripts.list_containers.runs_outputs
```

#### civis.io.file to civis

```
civis.io.file_to_civis (buf, name, api_key=None, client=None, **kwargs)
Upload a file to Civis.
```

#### **Parameters**

**buf** [file-like object or str] The file or other buffer that you wish to upload. Strings will be treated as paths to local files to open.

**name** [str] The name you wish to give the file.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS\_API\_KEY environment variable will be used.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

\*\*kwargs [kwargs] Extra keyword arguments will be passed to the file creation endpoint. See post ().

#### Returns

file id [int] The new Civis file ID.

#### **Notes**

If you are opening a binary file (e.g., a compressed archive) to pass to this function, do so using the 'rb' (read binary) mode (e.g., open ('myfile.zip', 'rb')).

Warning: If the file-like object is seekable, the current position will be reset to 0.

This facilitates retries and is used to chunk files for multipart uploads for improved performance.

Small or non-seekable file-like objects will be uploaded with a single post.

#### **Examples**

```
>>> # Upload file at a given path on the local filesystem.
>>> file_id = file_to_civis("my_data.csv", 'my_data')
>>> # Upload file which expires in 30 days
>>> with open("my_data.csv", "r") as f:
... file_id = file_to_civis(f, 'my_data')
>>> # Upload file which never expires
>>> with open("my_data.csv", "r") as f:
... file_id = file_to_civis(f, 'my_data', expires_at=None)
```

#### civis.io.file to dataframe

```
civis.io.file_to_dataframe (file_id, compression='infer', client=None, **read_kwargs)

Load a DataFrame from a CSV stored in a Civis File
```

The DataFrame will be read directly from Civis without copying the CSV to a local file on disk.

#### **Parameters**

file id [int] ID of a Civis File which contains a CSV

**compression** [str, optional] If "infer", set the compression argument of pandas. read\_csv based on the file extension of the name of the Civis File. Otherwise pass this argument to pandas.read\_csv.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

\*\*read\_kwargs Additional arguments will be passed directly to read\_csv().

#### Returns

:class:'~pandas.DataFrame' containing the contents of the CSV

#### Raises

ImportError If pandas is not available

#### See also:

pandas.read\_csv

#### civis.io.file to json

```
civis.io.file_to_json (file_id, client=None, **json_kwargs)
Restore JSON stored in a Civis File
```

#### **Parameters**

file\_id [int] ID of a JSON-formatted Civis File

client [civis.APIClient, optional] If not provided, an civis.APIClient object will
be created from the CIVIS API KEY.

\*\*json\_kwargs Additional keyword arguments will be passed directly to json.load().

#### Returns

The object extracted from the JSON-formatted file

#### See also:

```
civis_to_file(), json.load()
```

### 6.2.3 Databases

These functions move data from one database to another and expose an interface to run SQL in the database. Use  $query\_civis()$  when you need to execute SQL that does not return data (for example, a GRANT or DROP TABLE statement).

$transfer\_table(source\_db, dest\_db,[,])$	Transfer a table from one location to another.
<pre>query_civis(sql, database[, api_key,])</pre>	Execute a SQL statement as a Civis query.

#### civis.io.transfer table

civis.io.transfer\_table (source\_db, dest\_db, source\_table, dest\_table, job\_name=None, api\_key=None, client=None, source\_credential\_id=None, dest\_credential\_id=None, polling\_interval=None, \*\*advanced\_options)

Transfer a table from one location to another.

#### **Parameters**

- **source\_db** [str or int] The name of the database where the source table is located. Optionally, could be the database ID.
- **dest\_db** [str or int] The name of the database where the table will be transfered. Optionally, could be the database ID.
- source table [str] Full name of the table to transfer, e.g., 'schema.table'.
- dest\_table [str] Full name of the table in the destination database, e.g., 'schema.table'.
- **job\_name** [str, optional] A name to give the job. If omitted, a random job name will be used.
- **api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS\_API\_KEY environment variable will be used.
- client [civis.APIClient, optional] If not provided, an civis.APIClient object will
  be created from the CIVIS\_API\_KEY.
- **source\_credential\_id** [str or int, optional] Optional credential ID for the source database. If None, the default credential will be used.
- **dest\_credential\_id** [str or int, optional] Optional credential ID for the destination database. If None, the default credential will be used.
- **polling\_interval** [int or float, optional] Number of seconds to wait between checks for job completion.
- \*\*advanced\_options [kwargs] Extra keyword arguments will be passed to the import sync job. See post\_syncs().

#### Returns

results [CivisFuture] A CivisFuture object.

#### **Examples**

```
>>> transfer_table(source_db='Cluster A', dest_db='Cluster B', ... source_table='schma.tbl', dest_table='schma.tbl')
```

#### civis.io.query civis

civis.io.query\_civis(sql, database, api\_key=None, client=None, credential\_id=None, preview\_rows=10, polling\_interval=None, hidden=True) Execute a SQL statement as a Civis query.

Run a query that may return no results or where only a small preview is required. To execute a query that returns a large number of rows, see read\_civis\_sql().

#### **Parameters**

sql [str] The SQL statement to execute.

**database** [str or int] The name or ID of the database.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS\_API\_KEY environment variable will be used.

client [civis.APIClient, optional] If not provided, an civis.APIClient object will
be created from the CIVIS API KEY.

credential\_id [str or int, optional] The ID of the database credential. If None, the default credential will be used.

**preview\_rows** [int, optional] The maximum number of rows to return. No more than 100 rows can be returned at once.

**polling\_interval** [int or float, optional] Number of seconds to wait between checks for query completion.

hidden [bool, optional] If True (the default), this job will not appear in the Civis UI.

#### Returns

results [CivisFuture] A CivisFuture object.

#### **Examples**

```
>>> run = query_civis(sql="DELETE schema.table", database='database')
>>> run.result() # Wait for query to complete
```

## 6.3 Machine Learning

CivisML uses the Civis Platform to train machine learning models and parallelize their predictions over large datasets. It contains best-practice models for general-purpose classification and regression modeling as well as model quality evaluations and visualizations. All CivisML models use the scikit-learn API for interoperability with other platforms and to allow you to leverage resources in the open-source software community when creating machine learning models.

#### 6.3.1 Optional dependencies

You do not need any external libraries installed to use CivisML, but the following pip-installable dependencies enhance the capabilities of the <code>ModelPipeline</code>:

- pandas
- · scikit-learn
- glmnet
- · feather-format
- · civisml-extensions
- muffnn

Install pandas if you wish to download tables of predictions. You can also model on DataFrame objects in your interpreter.

If you wish to use the ModelPipeline code to model on DataFrame objects in your local environment, the feather-format package (requires pandas >= 0.20) will improve data transfer speeds and guarantee that your data types

are correctly detected by CivisML. You must install *feather-format* if you wish to use *pd.Categorical* columns in your *DataFrame* objects, since that type information is lost when writing data as a CSV.

If you wish to use custom models or download trained models, you'll need scikit-learn installed.

Several pre-defined models rely on public Civis Analytics libraries. The "sparse\_logistic", "sparse\_linear\_regressor", "sparse\_ridge\_regressor", "stacking\_classifier", and "stacking\_regressor" models all use the glmnet library. Pre-defined MLP models ("multilayer\_perceptron\_classifier" and "multilayer\_perceptron\_regressor") depend on the muffnn library. Finally, models which use the default CivisML ETL, along with models which use stacking or hyperband, depend on civisml-extensions. Install these packages if you wish to download the pre-defined models that depend on them.

#### 6.3.2 Define Your Model

Start the modeling process by defining your model. Do this by creating an instance of the <code>ModelPipeline</code> class. Each <code>ModelPipeline</code> corresponds to a scikit-learn <code>Pipeline</code> which will run in Civis Platform. A <code>Pipeline</code> allows you to combine multiple modeling steps (such as missing value imputation and feature selection) into a single model. The <code>Pipeline</code> is treated as a unit – for example, cross-validation happens over all steps together.

You can define your model in two ways, either by selecting a pre-defined algorithm or by providing your own scikit-learn Pipeline or BaseEstimator object. Note that whichever option you chose, CivisML will pre-process your data using either its default ETL, or ETL that you provide (see *Custom ETL*).

If you have already trained a scikit-learn model outside of Civis Platform, you can register it with Civis Platform as a CivisML model so that you can score it using CivisML. Read *Registering Models Trained Outside of Civis* for how to do this.

#### **Pre-Defined Models**

You can use the following pre-defined models with CivisML. All models start by imputing missing values with the mean of non-null values in a column. The "sparse\_\*" models include a LASSO regression step (using the glmnet package) to do feature selection before passing data to the final model. In some models, CivisML uses default parameters different from those in scikit-learn, as indicated in the "Altered Defaults" column. All models also have random\_state=42.

Name	Model	Algorithm	Altered Defaults
	Type		
sparse_logistic	classifica-	LogisticRegression	C=499999950, tol=1e-08
	tion		
gradient_boosting_classifier	classifica-	GradientBoostingClassi-	n_estimators=500,
	tion	fier	max_depth=2
random_forest_classifier	classifica-	RandomForestClassifier	n_estimators=500,
	tion		max_depth=7
extra_trees_classifier	classifica-	ExtraTreesClassifier	n_estimators=500,
	tion		max_depth=7
multi-	classifica-	muffnn.MLPClassifier	
layer_perceptron_classifier	tion		
stacking_classifier	classifica-	civism-	
	tion	lext.StackedClassifier	
sparse_linear_regressor	regression	LinearRegression	
sparse_ridge_regressor	regression	Ridge	
gradient_boosting_regressor	regression	GradientBoostingRegres-	n_estimators=500,
		sor	max_depth=2
random_forest_regressor	regression	RandomForestRegressor	n_estimators=500,
			max_depth=7
extra_trees_regressor	regression	ExtraTreesRegressor	n_estimators=500,
			max_depth=7
multi-	regression	muffnn.MLPRegressor	
layer_perceptron_regressor			
stacking_regressor	regression	civism-	
		lext.StackedRegressor	

The "stacking\_classifier" model stacks the "gradient\_boosting\_classifier", and "random\_forest\_classifier" predefined models together with a glmnet.LogitNet(alpha=0, n\_splits=4, max\_iter=10000, tol=1e-5, scoring='log\_loss'). The models are combined using a Pipeline containing a Normalizer step, followed by LogisticRegressionCV with penalty='l2' and tol=1e-08. The "stacking\_regressor" works similarly, stacking together the "gradient\_boosting\_regressor" and "random\_forest\_regressor" models and a glmnet. ElasticNet(alpha=0, n\_splits=4, max\_iter=10000, tol=1e-5, scoring='r2'), combining them using NonNegativeLinearRegression. The estimators that are being stacked have the same names as the associated pre-defined models, and the meta-estimator steps are named "meta-estimator". Note that although default parameters are provided for multilayer perceptron models, it is highly recommended that multilayer perceptrons be run using hyperband.

#### **Custom Models**

You can create your own Pipeline instead of using one of the pre-defined ones. Create the object and pass it as the model parameter of the ModelPipeline. Your model must follow the scikit-learn API, and you will need to include any dependencies as Custom Dependencies if they are not already installed in CivisML. Preinstalled libraries available for your use include:

- scikit-learn v0.19.1
- glmnet v2.0.0
- xgboost v0.6a2
- muffnn v1.2.0
- civisml-extensions v.0.1.6

When you're assembling your own model, remember that you'll have to make certain that either you add a missing value imputation step or that your data doesn't have any missing values. If you're making a classification model, the model must have a predict\_proba method. If the class you're using doesn't have a predict\_proba method, you can add one by wrapping it in a CalibratedClassifierCV.

#### **Custom ETL**

By default, CivisML pre-processes data using the DataFrameETL class, with cols\_to\_drop equal to the excluded\_columns parameter. You can replace this with your own ETL by creating an object of class BaseEstimator and passing it as the etl parameter during training.

By default, DataFrameETL automatically one-hot encodes all categorical columns in the dataset. If you are passing a custom ETL estimator, you will have to ensure that no categorical columns remain after the transform method is called on the dataset.

## **Hyperparameter Tuning**

You can tune hyperparamters using one of two methods: grid search or hyperband. CivisML will perform grid search if you pass a dictionary of hyperparameters to the <code>cross\_validation\_parameters</code> parameter, where the keys are hyperparameter names, and the values are lists of hyperparameter values to grid search over. You can run hyperparameter tuning in parallel by setting the n\_jobs parameter to however many jobs you would like to run in parallel. By default, n\_jobs is dynamically calculated based on the resources available on your cluster, such that a modeling job will never take up more than 90% of the cluster resources at once.

Hyperband is an efficient approach to hyperparameter optimization, and recommended over grid search where possible. CivisML will perform hyperband optimization for a pre-defined model if you pass the string 'hyperband' to cross\_validation\_parameters. Hyperband is currently only supported for the following models: gradient\_boosting\_classifier, random\_forest\_classifier, extra\_trees\_classifier, multilayer\_perceptron\_classifier, stacking\_classifier, gradient\_boosting\_regressor, random\_forest\_regressor, extra\_trees\_regressor, multilayer\_perceptron\_regressor, and stacking\_regressor. Although hyperband is supported for stacking models, stacking itself is a kind of model tuning, and the combination of stacking and hyperband is likely too computationally intensive to be useful in many cases.

Hyperband cannot be used to tune GLMs. For this reason, preset GLMs do not have a hyperband option. Similarly, when <code>cross\_validation\_parameters='hyperband'</code> and the model is <code>stacking\_classifier</code> or <code>stacking\_regressor</code>, only the GBT and random forest steps of the stacker are tuned using hyperband. Note that if you want to use hyperband with a custom model, you will need to wrap your estimator in a <code>civismlext</code>. hyperbandSearchCV estimator yourself.

CivisML runs pre-defined models with hyperband using the following distributions:

The truncated exponential distribution for the gradient boosting classifier and regressor was chosen to skew the distribution toward small values, ranging between .0003 and .03, with a mean close to .006. Similarly, the truncated exponential distribution for the random forest and extra trees models skews toward small values, ranging between .01 and 1, and with a mean close to .1.

## **Custom Dependencies**

Installing packages from PyPI is straightforward. You can specify a dependencies

argument to <code>ModelPipeline</code> which will install the dependencies in your runtime environment. VCS support is also enabled (see docs.) Installing a remote git repository from, say, Github only requires passing the HTTPS URL in the form of, for example, <code>git+https://github.com/scikit-learn/scikit-learn</code>.

CivisML will run pip install [your package here]. We strongly encourage you to pin package versions for consistency. Example code looks like:

Additionally, you can store a remote git host's API token in the Civis Platform as a credential to use for installing private git repositores. For example, you can go to Github at the https://github.com/settings/tokens URL, copy your token into the password field of a credential, and pass the credential name to the git\_token\_name argument in <code>ModelPipeline</code>. This also works with other hosting services. A simple example of how to do this with API looks as follows

Note, installing private dependencies with submodules is not supported.

# 6.3.3 Asynchronous Execution

All calls to a <code>ModelPipeline</code> object are non-blocking, i.e. they immediately provide a result without waiting for the job in the Civis Platform to complete. Calls to <code>civis.ml.ModelPipeline.train()</code> and <code>civis.ml.ModelPipeline.train()</code> and <code>civis.ml.ModelPipeline.predict()</code> return a <code>ModelFuture</code> object, which is a subclass of <code>Future</code> from the Python standard library. This behavior lets you train multiple models at once, or generate predictions from models, while still doing other work while waiting for your jobs to complete.

The ModelFuture can find and retrieve outputs from your CivisML jobs, such as trained Pipeline objects or out-of-sample predictions. The ModelFuture only downloads outputs when you request them.

## 6.3.4 Model Persistence

Civis Platform permanently stores all models, indexed by the job ID and the run ID (also called a "build") of the training job. If you wish to use an existing model, call <code>civis.ml.ModelPipeline.from\_existing()</code> with the job ID of the training job. You can find the job ID with the <code>train\_job\_id</code> attribute of a <code>ModelFuture</code>, or by looking at the URL of your model on the Civis Platform models page. If the training job has multiple runs, you may also provide a run ID to select a run other than the most recent. You can list all model runs of a training job by calling <code>civis.APIClient().jobs.get(train\_job\_id)['runs']</code>. You may also store the <code>ModelPipeline</code> itself with the <code>pickle</code> module.

# 6.3.5 Examples

Future objects have the method add\_done\_callback(). This is called as soon as the run completes. It takes a single argument, the Future for the completed job. You can use this method to chain jobs together:

```
from concurrent import futures
from civis.ml import ModelPipeline
import pandas as pd

df = pd.read_csv('data.csv')
training, predictions = [], []
model = ModelPipeline('sparse_logistic', dependent_variable='type')
training.append(model.train(df))
training[-1].add_done_callback(lambda fut: predictions.append(model.predict(df)))
futures.wait(training) # Blocks until all training jobs complete
futures.wait(predictions) # Blocks until all prediction jobs complete
```

You can create and train multiple models at once to find the best approach for solving a problem. For example:

# 6.3.6 Registering Models Trained Outside of Civis

Instead of using CivisML to train your model, you may train any scikit-learn-compatible model outside of Civis Platform and use <code>civis.ml.ModelPipeline.register\_pretrained\_model()</code> to register it as a CivisML model in Civis Platform. This will let you use Civis Platform to make predictions using your model, either to take advantage of distributed predictions on large datasets, or to create predictions as part of a workflow or service in Civis Platform.

When registering a model trained outside of Civis Platform, you are strongly advised to provide an ordered list of feature names used for training. This will allow CivisML to ensure that tables of data input for predictions have the correct features in the correct order. If your model has more than one output, you should also provide a list of output names so that CivisML knows how many outputs to expect and how to name them in the resulting table of model predictions.

If your model uses dependencies which aren't part of the default CivisML execution environment, you must provide them to the dependencies parameter of the <code>register\_pretrained\_model()</code> function, just as with the <code>ModelPipeline</code> constructor.

## 6.3.7 Object reference

Interface for scikit-learn modeling in the Civis Platform

Each ModelPipeline corresponds to a scikit-learn Pipeline which will run in Civis Platform.

Note that this object can be safely pickled and unpickled, but it does not store the state of any attached APIClient object. An unpickled ModelPipeline will use the API key from the user's environment.

#### **Parameters**

- **model** [string or Estimator] Either the name of a pre-defined model (e.g. "sparse\_logistic" or "gradient\_boosting\_classifier") or else a pre-existing Estimator object.
- **dependent\_variable** [string or List[str]] The dependent variable of the training dataset. For a multi-target problem, this should be a list of column names of dependent variables. Nulls in a single dependent variable will automatically be dropped.
- **primary\_key** [string, optional] The unique ID (primary key) of the training dataset. This will be used to index the out-of-sample scores.
- **parameters** [dict, optional] Specify parameters for the final stage estimator in a predefined model, e.g. { 'C': 2} for a "sparse\_logistic" model.
- cross\_validation\_parameters [dict or string, optional] Options for cross validation. For grid
   search, supply a parameter grid as a dictionary, e.g., {{'n\_estimators': [100,
   200, 500], 'learning\_rate': [0.01, 0.1], 'max\_depth': [2,
   3]}}. For hyperband, pass the string "hyperband".
- **model\_name** [string, optional] The prefix of the Platform modeling jobs. It will have "Train" or "Predict" added to become the Script title.
- **calibration** [{None, "sigmoid", "isotonic"}] If not None, calibrate output probabilities with the selected method. Valid only with classification models.
- **excluded\_columns** [array, optional] A list of columns which will be considered ineligible to be independent variables.
- **client** [APIClient, optional] If not provided, an APIClient object will be created from the CIVIS\_API\_KEY.
- **cpu\_requested** [int, optional] Number of CPU shares requested in the Civis Platform for training jobs. 1024 shares = 1 CPU.
- **memory\_requested** [int, optional] Memory requested from Civis Platform for training jobs, in MiB
- disk\_requested [float, optional] Disk space requested on Civis Platform for training jobs, in GB
- **notifications** [dict] See post\_custom() for further documentation about email and URL notification.
- **dependencies** [array, optional] List of packages to install from PyPI or git repository (e.g., Github or Bitbucket). If a private repo is specified, please include a git\_token\_name argument as well (see below). Make sure to pin dependencies to a specific version, since dependencies will be reinstalled during every training and predict job.

- **git\_token\_name** [str, optional] Name of remote git API token stored in Civis Platform as the password field in a custom platform credential. Used only when installing private git repositories.
- **verbose** [bool, optional] If True, supply debug outputs in Platform logs and make prediction child jobs visible.
- **etl** [Estimator, optional] Custom ETL estimator which overrides the default ETL, and is run before training and validation.

civis.ml.ModelFuture

# **Examples**

```
>>> from civis.ml import ModelPipeline
>>> model = ModelPipeline('gradient_boosting_classifier', 'depvar',
                          primary key='voterbase id')
>>> train = model.train(table_name='schema.survey_data',
                        fit_params={'sample_weight': 'survey_weight'},
                        database_name='My Redshift Cluster',
                        oos_scores='scratch.survey_depvar_oos_scores')
. . .
>>> train
<ModelFuture at 0x11be7ae10 state=queued>
>>> train.running()
True
>>> train.done()
False
>>> df = train.table # Read OOS scores from its Civis File. Blocking.
>>> meta = train.metadata  # Metadata from training run
>>> train.metrics['roc_auc']
0.88425
>>> pred = model.predict(table_name='schema.demographics_table ',
                         database_name='My Redshift Cluster',
                         output_table='schema.predicted_survey_response',
. . .
                         if_exists='drop')
. . .
>>> df_pred = pred.table # Blocks until finished
# Modify the parameters of the base estimator in a default model:
>>> model = ModelPipeline('sparse_logistic', 'depvar',
                          primary_key='voterbase_id',
                          parameters={'C': 2})
# Grid search over hyperparameters in the base estimator:
>>> model = ModelPipeline('sparse_logistic', 'depvar',
                          primary_key='voterbase_id',
. . .
                          cross_validation_parameters={'C': [0.1, 1, 10]})
. . .
```

### Attributes

estimator [Pipeline] The trained scikit-learn Pipeline
train\_result\_ [ModelFuture] ModelFuture encapsulating this model's training run
state [str] Status of the training job (non-blocking)

## **Methods**

train()	Train the model on data in Civis Platform; outputs ModelFuture
predict()	Make predictions on new data; outputs ModelFuture
from_existing()	Class method; use to create a ModelPipeline from an existing model training run

classmethod from\_existing (train\_job\_id, train\_run\_id='latest', client=None)

Create a ModelPipeline object from existing model IDs

#### **Parameters**

train\_job\_id [int] The ID of the CivisML job in the Civis Platformtrain\_run\_id [int or string, optional] Location of the model run, either

- an explicit run ID,
- "latest": The most recent run
- "active": The run designated by the training job's "active build" parameter

client [APIClient, optional] If not provided, an APIClient object will be created from
the CIVIS API KEY.

#### Returns

:class: '~civis.ml.ModelPipeline' A ModelPipeline which refers to a previously-trained model

## **Examples**

```
>>> from civis.ml import ModelPipeline
>>> model = ModelPipeline.from_existing(job_id)
>>> model.train_result_.metrics['roc_auc']
0.843
```

Provide input through one of a DataFrame (df), a local CSV (csv\_path), a Civis Table (table\_name and database\_name), a Civis File containing a CSV (file\_id), or a Civis File containing a manifest file (manifest).

A "manifest file" is JSON which specifies the location of many shards of the data to be used for prediction. A manifest file is the output of a Civis export job with force\_multifile=True set, e.g. from <code>civis.io.civis\_to\_multifile\_csv()</code>. Large Civis Tables (provided using table\_name) will automatically be exported to manifest files.

Prediction outputs will always be stored as gzipped CSVs in one or more Civis Files. You can find a list of File ID numbers for output files at the "output\_file\_ids" key in the metadata returned by the prediction job. Provide an output\_table (and optionally an output\_db, if it's different from database\_name) to copy these predictions into a Civis Table.

#### **Parameters**

df [pd.DataFrame, optional] A DataFrame of data for prediction. The DataFrame will be uploaded to a Civis file so that CivisML can access it. Note that the index of the DataFrame will be ignored—use df.reset\_index() if you want your index column to be included with the data passed to CivisML. NB: You must install feather—format if your DataFrame contains Categorical columns, to ensure that CivisML preserves data types.

**csv\_path** [str, optional] The location of a CSV of data on the local disk. It will be uploaded to a Civis file.

table\_name [str, optional] The qualified name of the table containing your data

database\_name [str, optional] Name of the database holding the data, e.g., 'My Redshift Cluster'.

manifest [int, optional] ID for a manifest file stored as a Civis file. (Note: if the manifest is not a Civis Platform-specific manifest, like the one returned from civis.io. civis\_to\_multfile\_csv(), this must be used in conjunction with table\_name and database\_name due to the need for column discovery via Redshift.)

file\_id [int, optional] If the data are a CSV stored in a Civis file, provide the integer file ID.

sql\_where [str, optional] A SQL WHERE clause used to scope the rows to be predicted

sql\_limit [int, optional] SQL LIMIT clause to restrict the size of the prediction set

**primary\_key** [str, optional] Primary key of the prediction table. Defaults to the primary key of the training data. Use None to indicate that the prediction data don't have a primary key column.

output\_table: str, optional The table in which to put the predictions.

output\_db [str, optional] Database of the output table. Defaults to the database of the input table.

**if\_exists** [{'fail', 'append', 'drop', 'truncate'}] Action to take if the prediction table already exists.

**n\_jobs** [int, optional] Number of concurrent Platform jobs to use for multi-file / large table prediction. Defaults to *None*, which allows CivisML to dynamically calculate an appropriate number of workers to use (in general, as many as possible without using all resources in the cluster).

**polling\_interval** [float, optional] Check for job completion every this number of seconds. Do not set if using the notifications endpoint.

**cpu** [int, optional] CPU shares requested by the user for a single job.

**memory** [int, optional] RAM requested by the user for a single job.

**disk\_space** [float, optional] disk space requested by the user for a single job.

dvs\_to\_predict [list of str, optional] If this is a multi-output model, you may list a subset of dependent variables for which you wish to generate predictions. This list must be a subset of the original dependent\_variable input. The scores for the returned subset will be identical to the scores which those outputs would have had if all outputs were written, but ignoring some of the model's outputs will let predictions complete faster and use less disk space. The default is to produce scores for all DVs.

## Returns

:class:'~civis.ml.ModelFuture'

Use a fitted scikit-learn model with CivisML scoring

Use this function to set up your own fitted scikit-learn-compatible Estimator object for scoring with CivisML. This function will upload your model to Civis Platform and store enough metadata about it that you can subsequently use it with a CivisML scoring job.

The only required input is the model itself, but you are strongly recommended to also provide a list of feature names. Without a list of feature names, CivisML will have to assume that your scoring table contains only the features needed for scoring (perhaps also with a primary key column), in all in the correct order.

#### **Parameters**

- **model** [sklearn.base.BaseEstimator or int] The model object. This must be a fitted scikit-learn compatible Estimator object, or else the integer Civis File ID of a pickle or joblib-serialized file which stores such an object.
- **dependent\_variable** [string or List[str], optional] The dependent variable of the training dataset. For a multi-target problem, this should be a list of column names of dependent variables.
- **features** [string or List[str], optional] A list of column names of features which were used for training. These will be used to ensure that tables input for prediction have the correct features in the correct order.
- primary\_key [string, optional] The unique ID (primary key) of the scoring dataset
- **model\_name** [string, optional] The name of the Platform registration job. It will have "Predict" added to become the Script title for predictions.
- **dependencies** [array, optional] List of packages to install from PyPI or git repository (e.g., GitHub or Bitbucket). If a private repo is specified, please include a git\_token\_name argument as well (see below). Make sure to pin dependencies to a specific version, since dependencies will be reinstalled during every predict job.
- **git\_token\_name** [str, optional] Name of remote git API token stored in Civis Platform as the password field in a custom platform credential. Used only when installing private git repositories.
- **skip\_model\_check** [bool, optional] If you're sure that your model will work with CivisML, but it will fail the comprehensive verification, set this to True.
- **verbose** [bool, optional] If True, supply debug outputs in Platform logs and make prediction child jobs visible.
- client [APIClient, optional] If not provided, an APIClient object will be created from the CIVIS\_API\_KEY.

## **Returns**

:class:'~civis.ml.ModelPipeline'

## **Examples**

This example assumes that you already have training data X and y, where X is a DataFrame. >>> from civis.ml import ModelPipeline >>> from sklearn.linear\_model import Lasso >>> est = Lasso().fit(X, y) >>> model = ModelPipeline.register\_pretrained\_model(... est, 'concrete', features=X.columns) >>> model.predict(table\_name='my.table', database\_name='my-db')

train (df=None, csv\_path=None, table\_name=None, database\_name=None, file\_id=None, sql\_where=None, sql\_limit=None, oos\_scores=None, oos\_scores\_db=None, if\_exists='fail', fit\_params=None, polling\_interval=None, validation\_data='train', n\_jobs=None)
Start a Civis Platform job to train your model

Provide input through one of a DataFrame (df), a local CSV (csv\_path), a Civis Table (table\_name and database\_name), or a Civis File containing a CSV (file\_id).

Model outputs will always contain out-of-sample scores (accessible through ModelFuture.table on this function's output), and you may chose to store these out-of-sample scores in a Civis Table with the oos scores, oos scores db, and if exists parameters.

#### **Parameters**

- df [pd.DataFrame, optional] A DataFrame of training data. The DataFrame will be uploaded to a Civis file so that CivisML can access it. Note that the index of the DataFrame will be ignored use df.reset\_index() if you want your index column to be included with the data passed to CivisML. NB: You must install feather-format if your DataFrame contains Categorical columns, to ensure that CivisML preserves data types.
- **csv\_path** [str, optional] The location of a CSV of data on the local disk. It will be uploaded to a Civis file.
- **table\_name** [str, optional] The qualified name of the table containing the training set from which to build the model.
- **database\_name** [str, optional] Name of the database holding the training set table used to build the model. E.g., 'My Cluster Name'.
- **file\_id** [int, optional] If the training data are stored in a Civis file, provide the integer file ID.
- sql\_where [str, optional] A SQL WHERE clause used to scope the rows of the training set (used for table input only)
- **sql\_limit** [int, optional] SQL LIMIT clause for querying the training set (used for table input only)
- **oos\_scores** [str, optional] If provided, store out-of-sample predictions on training set data to this Redshift "schema.tablename".
- oos\_scores\_db [str, optional] If not provided, store OOS predictions in the same database
  which holds the training data.
- **if\_exists** [{'fail', 'append', 'drop', 'truncate'}] Action to take if the out-of-sample prediction table already exists.
- fit\_params: Dict[str, str] Mapping from parameter names in the model's fit method
   to the column names which hold the data, e.g. {'sample\_weight':
   'survey\_weight\_column'}.
- **polling\_interval** [float, optional] Check for job completion every this number of seconds. Do not set if using the notifications endpoint.

- **validation\_data** [str, optional] Source for validation data. There are currently two options: 'train' (the default), which cross-validates over training data for validation; and 'skip', which skips the validation step.
- **n\_jobs** [int, optional] Number of jobs to use for training and validation. Defaults to *None*, which allows CivisML to dynamically calculate an appropriate number of workers to use (in general, as many as possible without using all resources in the cluster). Increase **n\_jobs** to parallelize over many hyperparameter combinations in grid search/hyperband, or decrease to use fewer computational resources at once.

#### **Returns**

#### :class:'~civis.ml.ModelFuture'

 $\begin{array}{c} \textbf{class} \ \, \texttt{civis.ml.ModelFuture} \, (job\_id, \qquad run\_id, \qquad train\_job\_id=None, \qquad train\_run\_id=None, \\ \qquad \qquad polling\_interval=None, \, client=None, \, poll\_on\_creation=True) \\ \qquad \text{Encapsulates asynchronous execution of a CivisML job} \end{array}$ 

This object knows where to find modeling outputs from CivisML jobs. All data attributes are lazily retrieved and block on job completion.

This object can be pickled, but it does not store the state of the attached APIClient object. An unpickled ModelFuture will use the API key from the user's environment.

#### **Parameters**

job\_id [int] ID of the modeling job

run\_id [int] ID of the modeling run

**train\_job\_id** [int, optional] If not provided, this object is assumed to encapsulate a training job, and train\_job\_id will equal job\_id.

**train\_run\_id** [int, optional] If not provided, this object is assumed to encapsulate a training run, and train\_run\_id will equal run\_id.

**polling\_interval** [int or float, optional] The number of seconds between API requests to check whether a result is ready. The default intelligently switches between a short interval if pubnub is not available and a long interval for pubnub backup if that library is installed.

**client** [civis.APIClient, optional] If not provided, an civis.APIClient object will be created from the CIVIS\_API\_KEY.

**poll\_on\_creation** [bool, optional] If True (the default), it will poll upon calling result () the first time. If False, it will wait the number of seconds specified in *polling\_interval* from object creation before polling.

#### See also:

civis.futures.CivisFuture, civis.futures.ContainerFuture, concurrent.
futures.Future

## Attributes

metadata [dict, blocking] The metadata associated with this modeling job

metrics [dict, blocking] Validation metrics from this job's training

validation\_metadata [dict, blocking] Metadata from this modeling job's validation run

**train\_metadata** [dict, blocking] Metadata from this modeling job's training run (will be identical to *metadata* if this is a training run)

**estimator** [sklearn.pipeline.Pipeline, blocking] The fitted scikit-learn Pipeline resulting from this model run

**table** [pandas.DataFrame, blocking] The table output from this modeling job: out-of-sample predictions on the training set for a training job, or a table of predictions for a prediction job. If the prediction job was split into multiple files (this happens automatically for large tables), this attribute will provide only predictions for the first file.

state [str] The current state of the Civis Platform run

job id [int]

run id [int]

**train\_job\_id** [int] Container ID for the training job – identical to job\_id if this is a training job.

train\_run\_id [int] As train\_job\_id but for runs

is\_training [bool] True if this ModelFuture corresponds to a train-validate job.

#### **Methods**

cancel()	Cancels the corresponding Platform job before completion
succeeded()	(Non-blocking) Is the job a success?
failed()	(Non-blocking) Did the job fail?
cancelled()	(Non-blocking) Was the job cancelled?
running()	(Non-blocking) Is the job still running?
done()	(Non-blocking) Is the job finished?
result()	(Blocking) Return the final status of the Civis Platform job.

## add\_done\_callback (fn)

Attaches a callable that will be called when the future finishes.

### Args:

**fn:** A callable that will be called with this future as its only argument when the future completes or is cancelled. The callable will always be called by a thread in the same process in which it was added. If the future has already completed or been cancelled then the callable will be called immediately. These callables are called in the order that they were added.

## cancel()

Submit a request to cancel the container/script/run.

#### Returns

**bool** Whether or not the job is in a cancelled state.

## cancelled()

Return True if the future was cancelled.

#### done()

Return True of the future was cancelled or finished executing.

## exception (timeout=None)

Return the exception raised by the call that the future represents.

#### Args:

**timeout:** The number of seconds to wait for the exception if the future isn't done. If None, then there is no limit on the wait time.

**Returns:** The exception raised by the call that the future represents or None if the call completed without raising.

**Raises:** CancelledError: If the future was cancelled. TimeoutError: If the future didn't finish executing before the given

timeout.

#### failed()

Return True if the Civis job failed.

#### result (timeout=None)

Return the result of the call that the future represents.

## Args:

**timeout: The number of seconds to wait for the result if the future** isn't done. If None, then there is no limit on the wait time.

**Returns:** The result of the call that the future represents.

**Raises:** CancelledError: If the future was cancelled. TimeoutError: If the future didn't finish executing before the given

timeout.

Exception: If the call raised then that exception will be raised.

#### running()

Return True if the future is currently executing.

## set\_exception(exception)

Sets the result of the future as being the given exception.

Should only be used by Executor implementations and unit tests.

## set\_result (result)

Sets the return value of work associated with the future.

Should only be used by Executor implementations and unit tests.

## set\_running\_or\_notify\_cancel()

Mark the future as running or process any cancel notifications.

Should only be used by Executor implementations and unit tests.

If the future has been cancelled (cancel() was called and returned True) then any threads waiting on the future completing (though calls to as\_completed() or wait()) are notified and False is returned.

If the future was not cancelled then it is put in the running state (future calls to running() will return True) and True is returned.

This method should be called by Executor implementations before executing the work associated with this future. If this method returns False then the work should not be executed.

**Returns:** False if the Future was cancelled. True otherwise.

#### Raises:

RuntimeError: if this method was already called or if set\_result() or set\_exception() was called.

## succeeded()

Return True if the job completed in Civis with no error.

# 6.4 Parallel Computation

The Civis Platform manages a pool of cloud computing resources. You can access these resources with the tools in the civis.parallel and civis.futures modules.

## 6.4.1 Joblib backend

If you can divide your work into multiple independent chunks, each of which takes at least several minutes to run, you can reduce the time your job takes to finish by running each chunk simultaneously in Civis Platform. The Civis joblib backend is a software tool which makes it easier to run many jobs simultaneously.

Things to keep in mind when deciding if the Civis joblib backend is the right tool for your code:

- Each function call which is parallelized with the Civis joblib backend will run in a different Civis Platform script. Creating a new script comes with some overhead. It will take between a few seconds and a few minutes for each script to start, depending on whether Civis Platform needs to provision additional resources. If you expect that each function call will complete quickly, instead consider either running them in serial or using extra processes in the same Civis Platform script.
- Because function calls run in different scripts, function inputs and outputs must be uploaded to Civis Platform
  from their origin script and downloaded into their destination. If your functions take very large inputs and/or
  produce very large outputs, moving the data around will cause additional overhead. Consider either using a
  different tool or refactoring your code so that the function to be parallelized is no longer moving around large
  amounts of data.
- Some open-source libraries, such as scikit-learn, use joblib to do computations in parallel. If you're working with such a library, the Civis joblib backend provides an easy way to run these parallel computations in different Civis Platform scripts.

#### **Joblib**

joblib is an open source Python library which facilitates parallel processing in Python. Joblib uses Python's multiprocessing library to run functions in parallel, but it also allows users to define their own "back end" for parallel computation. The Civis Python API client takes advantage of this to let you easily run your own code in parallel through Civis Platform.

The make\_backend\_factory(), infer\_backend\_factory(), and make\_backend\_template\_factory() functions allow you to define a "civis" parallel computation backend which will transparently distribute computation in cloud resources managed by the Civis Platform.

See the joblib user guide for examples of using joblib to do parallel computation. Note that the descriptions of "memmapping" aren't relevant to using Civis Platform as a backend, since your jobs will potentially run on different computers and can't share memory. Using the Civis joblib backend to run jobs in parallel in the cloud looks the same as running jobs in parallel on your local computer, except that you first need to set up the "civis" backend.

## How to use

Begin by defining the backend. The Civis joblib backend creates and runs Container Scripts, and the <code>make\_backend\_factory()</code> function accepts several arguments which will be passed to <code>post\_containers()</code>. For example, you could pass a <code>repo\_http\_uri</code> or <code>repo\_ref</code> to clone a repository from GitHub into the container which will run your function. Use the <code>docker\_image\_name</code> and <code>docker\_image\_tag</code> to select a custom Docker image for your job. You can provide a <code>setup\_cmd</code> to run setup in bash before your function executes in Python. The default <code>setup\_cmd</code> will run <code>python</code> <code>setup.py</code>

install in the base directory of any repo\_http\_uri which you include in your backend setup. Make sure that the environment you define for your Civis backend includes all of the code which your parallel function will call.

The <code>make\_backend\_factory()</code> function will return a backend factory which should be given to the <code>joblib.register\_parallel\_backend()</code> function. For example:

```
>>> from joblib import register_parallel_backend
>>> from civis.parallel import make_backend_factory
>>> be_factory = make_backend_factory()
>>> register_parallel_backend('civis', be_factory)
```

Direct joblib to use a custom backend by entering a joblib.parallel\_backend() context:

```
>>> from joblib import parallel_backend
>>> with parallel_backend('civis'):
... # Do joblib parallel computation here.
```

You can find more about custom joblib backends in the joblib documentation.

Note that joblib.Parallel takes both a n\_jobs and pre\_dispatch parameter. The Civis joblib backend doesn't queue submitted jobs itself, so it will run pre\_dispatch jobs at once. The default value of pre\_dispatch is "2\*n\_jobs", which will run a maximum of 2 \* n\_jobs jobs at once in the Civis Platform. Set pre\_dispatch="n\_jobs" in your Parallel call to run at most n\_jobs jobs.

The Civis joblib backend uses cloudpickle to transport code and data from the parent environment to the Civis Platform. This means that you may parallelize dynamically-defined functions and classes, including lambda functions.

The joblib backend will automatically add environment variables called "CIVIS\_PARENT\_JOB\_ID" and "CIVIS\_PARENT\_RUN\_ID", holding the values of the job and run IDs of the Civis Platform job in which you're running the joblib backend (if any). Your functions could use these to communicate with the parent job or to recognize that they're in a process which has been created by another Civis Platform job. However, where possible you should let the joblib backend itself transport the return value of the function it's running back to the parent.

#### Infer backend parameters

If you're writing code which will run inside a Civis Container Script, then the <code>infer\_backend\_factory()</code> function returns a backend factory with environment parameters pre-populated by inspecting the state of your container script at run time. Use <code>infer\_backend\_factory()</code> anywhere you would use <code>make\_backend\_factory()</code>, and you don't need to specify a Docker image or GitHub repository.

## **Templated Scripts**

The <code>make\_backend\_template\_factory()</code> is intended for developers who are writing code which may be run by users who don't have permissions to create new container scripts with the necessary environment.

Instead of defining and creating new container scripts with <code>make\_backend\_factory()</code>, you can use <code>make\_backend\_template\_factory()</code> to launch custom scripts from a templated script. To use the template factory, your backing container script must have the Civis Python client installed, and its run command must finish by calling <code>civis\_joblib\_worker</code> with no arguments. The template must accept the parameter "JOBLIB\_FUNC\_FILE\_ID". The Civis joblib backend will use this parameter to transport your remote work.

## **Examples**

Parallel computation using the default joblib backend (this uses processes on your local computer):

```
>>> def expensive_calculation(num1, num2):
...     return 2 * num1 + num2
>>> from joblib import delayed, Parallel
>>> parallel = Parallel(n_jobs=5)
>>> args = [(0, 1), (1, 1), (2, 1), (3, 1), (4, 1), (5, 1), (6, 1)]
>>> print(parallel(delayed(expensive_calculation)(*a) for a in args))
[1, 3, 5, 7, 9, 11, 13]
```

You can do the same parallel computation using the Civis backend by creating and registering a backend factory and entering a with parallel\_backend('civis') context. The code below will start seven different jobs in Civis Platform (with up to five running at once). Each job will call the function expensive\_calculation with a different set of arguments from the list args.:

```
>>> def expensive_calculation(num1, num2):
...     return 2 * num1 + num2
>>> from joblib import delayed, Parallel
>>> from joblib import parallel_backend, register_parallel_backend
>>> from civis.parallel import make_backend_factory
>>> register_parallel_backend('civis', make_backend_factory(
...     required_resources={"cpu": 512, "memory": 256}))
>>> args = [(0, 1), (1, 1), (2, 1), (3, 1), (4, 1), (5, 1), (6, 1)]
>>> with parallel_backend('civis'):
...     parallel = Parallel(n_jobs=5, pre_dispatch='n_jobs')
...     print(parallel(delayed(expensive_calculation)(*a) for a in args))
[1, 3, 5, 7, 9, 11, 13]
```

You can use the Civis joblib backend to parallelize any code which uses joblib internally, such as scikit-learn:

```
>>> from joblib import parallel_backend, register_parallel_backend
>>> from sklearn.model_selection import GridSearchCV
>>> from sklearn.ensemble import GradientBoostingClassifier
>>> from sklearn.datasets import load_digits
>>> digits = load_digits()
>>> param_grid = {
        "max_depth": [1, 3, 5, None],
       "max_features": ["sqrt", "log2", None],
. . .
        "learning_rate": [0.1, 0.01, 0.001]
. . .
...}
>>> # Note: n_jobs and pre_dispatch specify the maximum number of
>>> # concurrent jobs.
>>> gs = GridSearchCV(GradientBoostingClassifier(n_estimators=1000,
                                                  random_state=42),
                      param_grid=param_grid,
. . .
                      n_jobs=5, pre_dispatch="n_jobs")
>>> register_parallel_backend('civis', make_backend_factory(
       required_resources={"cpu": 512, "memory": 256}))
>>> with parallel_backend('civis'):
        gs.fit(digits.data, digits.target)
```

## Debugging

Any (non-retried) errors in child jobs will cause the entire parallel call to fail. joblib will transport the first exception from a remote job and raise it in the parent process so that you can debug.

If your remote jobs are failing because of network problems (e.g. occasional 500 errors), you can make your parallel call more likely to succeed by using a max\_job\_retries value above 0 when creating your backend factory. This

will automatically retry a job (potentially more than once) before giving up and keeping an exception.

Logging: The Civis joblib backend uses the standard library logging module, with debug emits for events which might help you diagnose errors. See also the "verbose" argument to joblib.Parallel, which prints information to either stdout or stderr.

Mismatches between your local environment and the environment in the Civis container script jobs are a common source of errors. To run a function in the Civis platform, any modules called by that function must be importable from a Python interpreter running in the container script. For example, if you use <code>joblib.Parallel</code> with <code>numpy.sqrt()</code>, the joblib backend must be set to run your function in a container which has <code>numpy</code> installed. If you see an error such as:

```
ModuleNotFoundError: No module named 'numpy'
```

this signifies that the function you're trying to run doesn't exist in the remote environment. Select a Docker container with the module installed, or install it in your remote environment by using the repo\_http\_uri parameter of make\_backend\_factory() to install it from GitHub.

# 6.4.2 Object Reference

Parallel computations using the Civis Platform infrastructure

```
exception civis.parallel.JobSubmissionError
```

```
civis.parallel.infer_backend_factory (required_resources=None, params=None, arguments=None, client=None, polling_interval=None, setup_cmd=None, max_submit_retries=0, max_job_retries=0, hidden=True, remote_backend='sequential', **kwargs)
```

Infer the container environment and return a backend factory.

This function helps you run additional jobs from code which executes inside a Civis container job. The function reads settings for relevant parameters (e.g. the Docker image) of the container it's running inside of.

Jobs created through this backend will have environment variables "CIVIS\_PARENT\_JOB\_ID" and "CIVIS\_PARENT\_RUN\_ID" with the contents of the "CIVIS\_JOB\_ID" and "CIVIS\_RUN\_ID" of the environment which created them. If the code doesn't have "CIVIS\_JOB\_ID" and "CIVIS\_RUN\_ID" environment variables available, the child will not have "CIVIS\_PARENT\_JOB\_ID" and "CIVIS\_PARENT\_RUN\_ID" environment variables.

**Note:** This function will read the state of the parent container job at the time this function executes. If the user has modified the container job since the run started (e.g. by changing the GitHub branch in the container's GUI), this function may infer incorrect settings for the child jobs.

Keyword arguments inferred from the existing script's state are ['docker\_image\_name', 'docker\_image\_tag', 'repo\_http\_uri', 'repo\_ref', 'remote\_host\_credential\_id', 'git\_credential\_id', 'cancel\_timeout', 'time\_zone']

## **Parameters**

**required\_resources** [dict or None, optional] The resources needed by the container. See the *container scripts API documentation <a href="https://platform.civisanalytics.com/api#resources-scripts">https://platform.civisanalytics.com/api#resources-scripts</a> for details. Resource requirements not specified will default to the requirements of the current job.* 

**params** [list or None, optional] A definition of the parameters this script accepts in the arguments field. See the *container scripts API documentation* <a href="https://platform.civisanalytics.com/api#resources-scripts">https://platform.civisanalytics.com/api#resources-scripts</a> for details.

Parameters of the child jobs will default to the parameters of the current job. Any parameters provided here will override parameters of the same name from the current job.

**arguments** [dict or None, optional] Dictionary of name/value pairs to use to run this script. Only settable if this script has defined params. See the *container scripts API documentation* <a href="https://platform.civisanalytics.com/api#resources-scripts">https://platform.civisanalytics.com/api#resources-scripts</a> for details.

Arguments will default to the arguments of the current job. Anything provided here will override portions of the current job's arguments.

**client** [civis.APIClient instance or None, optional] An API Client object to use.

- **polling\_interval** [int, optional] The polling interval, in seconds, for checking container script status. If you have many jobs, you may want to set this higher (e.g., 300) to avoid *rate-limiting <a href="https://platform.civisanalytics.com/api#basics">https://platform.civisanalytics.com/api#basics</a>. You should only set this if you aren't using pubnub notifications.*
- **setup\_cmd** [str, optional] A shell command or sequence of commands for setting up the environment. These will precede the commands used to run functions in joblib. This is primarily for installing dependencies that are not available in the dockerhub repo (e.g., "cd/app && python setup.py install" or "pip install gensim").

With no GitHub repo input, the setup command will default to a command that does nothing. If a repo\_http\_uri is provided, the default setup command will attempt to run "python setup.py install". If this command fails, execution will still continue.

- max\_submit\_retries [int, optional] The maximum number of retries for submitting each job. This is to help avoid a large set of jobs failing because of a single 5xx error. A value higher than zero should only be used for jobs that are idempotent (i.e., jobs whose result and side effects are the same regardless of whether they are run once or many times).
- max\_job\_retries [int, optional] Retry failed jobs this number of times before giving up. Even
  more than with max\_submit\_retries, this should only be used for jobs which are
  idempotent, as the job may have caused side effects (if any) before failing. These retries
  assist with jobs which may have failed because of network or worker failures.
- **hidden: bool, optional** The hidden status of the object. Setting this to true hides it from most API endpoints. The object can still be queried directly by ID. Defaults to True.
- **remote\_backend** [str or object, optional] The name of a joblib backend or a joblib backend itself. This parameter is the joblib backend to use when executing code within joblib in the container. The default of 'sequential' uses the joblib sequential backend in the container. The value 'civis' uses an exact copy of the Civis joblib backend that launched the container. Note that with the value 'civis', one can potentially use more jobs than specified by n\_jobs.
- \*\*kwargs: Additional keyword arguments will be passed directly to post\_containers(), potentially overriding the values of those arguments in the parent environment.

## Raises

**RuntimeError** If this function is not running inside a Civis container job.

civis.parallel.make_backend_factory
```

```
civis.parallel.make_backend_factory (docker_image_name='civisanalytics/datascience-
python', client=None, polling_interval=None,
setup_cmd=None, max_submit_retries=0,
max_job_retries=0, hidden=True, re-
mote backend='sequential', **kwargs)
```

Create a joblib backend factory that uses Civis Container Scripts

Jobs created through this backend will have environment variables "CIVIS\_PARENT\_JOB\_ID" and "CIVIS\_PARENT\_RUN\_ID" with the contents of the "CIVIS\_JOB\_ID" and "CIVIS\_RUN\_ID" of the environment which created them. If the code doesn't have "CIVIS\_JOB\_ID" and "CIVIS\_RUN\_ID" environment variables available, the child will not have "CIVIS\_PARENT\_JOB\_ID" and "CIVIS\_PARENT\_RUN\_ID" environment variables.

**Note:** The total size of function parameters in *Parallel()* calls on this backend must be less than 5 GB due to AWS file size limits.

**Note:** The maximum number of concurrent jobs in the Civis Platform is controlled by both the n\_jobs and pre\_dispatch parameters of joblib.Parallel. Set pre\_dispatch="n\_jobs" to have a maximum of n\_jobs processes running at once. (The default is pre\_dispatch="2\*n\_jobs".)

#### **Parameters**

**docker\_image\_name** [str, optional] The image for the container script. You may also wish to specify a docker\_image\_tag in the keyword arguments.

**client** [civis.APIClient instance or None, optional] An API Client object to use.

- **polling\_interval** [int, optional] The polling interval, in seconds, for checking container script status. If you have many jobs, you may want to set this higher (e.g., 300) to avoid *rate-limiting <a href="https://platform.civisanalytics.com/api#basics">https://platform.civisanalytics.com/api#basics</a>. You should only set this if you aren't using pubnub notifications.*
- **setup\_cmd** [str, optional] A shell command or sequence of commands for setting up the environment. These will precede the commands used to run functions in joblib. This is primarily for installing dependencies that are not available in the dockerhub repo (e.g., "cd /app && python setup.py install" or "pip install gensim").
  - With no GitHub repo input, the setup command will default to a command that does nothing. If a *repo\_http\_uri* is provided, the default setup command will attempt to run "python setup.py install". If this command fails, execution will still continue.
- max\_submit\_retries [int, optional] The maximum number of retries for submitting each job. This is to help avoid a large set of jobs failing because of a single 5xx error. A value higher than zero should only be used for jobs that are idempotent (i.e., jobs whose result and side effects are the same regardless of whether they are run once or many times).
- max\_job\_retries [int, optional] Retry failed jobs this number of times before giving up. Even more than with max\_submit\_retries, this should only be used for jobs which are idempotent, as the job may have caused side effects (if any) before failing. These retries assist with jobs which may have failed because of network or worker failures.
- **hidden: bool, optional** The hidden status of the object. Setting this to true hides it from most API endpoints. The object can still be queried directly by ID. Defaults to True.
- **remote\_backend** [str or object, optional] The name of a joblib backend or a joblib backend itself. This parameter is the joblib backend to use when executing code within joblib in the container. The default of 'sequential' uses the joblib sequential backend in the container. The value 'civis' uses an exact copy of the Civis joblib backend that launched the container. Note that with the value 'civis', one can potentially use more jobs than specified by n\_jobs.

\*\*kwargs: Additional keyword arguments will be passed directly to post\_containers().

#### See also:

```
civis.APIClient.scripts.post_containers
```

#### **Notes**

Joblib's joblib.parallel.register\_parallel\_backend() (see example above) expects a callable that returns a joblib.parallel.ParallelBackendBase instance. This function allows the user to specify the Civis container script setting that will be used when that backend creates container scripts to run jobs.

The specified Docker image (optionally, with a GitHub repo and setup command) must have basically the same environment as the one in which this module is used to submit jobs. The worker jobs need to be able to deserialize the jobs they are given, including the data and all the necessary Python objects (e.g., if you pass a Pandas data frame, the image must have Pandas installed). You may use functions and classes dynamically defined in the code (e.g. lambda functions), but if your joblib-parallized function calls code imported from another module, that module must be installed in the remote environment.

# **Examples**

```
>>> # Without joblib:
>>> from __future__ import print_function
>>> from math import sqrt
>>> print([sqrt(i ** 2) for i in range(10)])
[0.0, 1.0, 2.0, 3.0, 4.0, 5.0, 6.0, 7.0, 8.0, 9.0]
```

```
>>> # Using the default joblib backend:
>>> from joblib import delayed, Parallel
>>> parallel = Parallel(n_jobs=5)
>>> print(parallel(delayed(sqrt)(i ** 2) for i in range(10)))
[0.0, 1.0, 2.0, 3.0, 4.0, 5.0, 6.0, 7.0, 8.0, 9.0]
```

(continues on next page)

(continued from previous page)

```
>>> param_grid = {
        "max_depth": [1, 3, 5, None],
        "max_features": ["sqrt", "log2", None],
        "learning_rate": [0.1, 0.01, 0.001]
. . .
...}
>>> # Note: n_jobs and pre_dispatch specify the maximum number of
>>> # concurrent jobs.
>>> gs = GridSearchCV(GradientBoostingClassifier(n_estimators=1000,
                                                  random_state=42),
                      param_grid=param_grid,
. . .
                      n_jobs=5, pre_dispatch="n_jobs")
>>> sklearn_register_parallel_backend('civis', make_backend_factory(
        required_resources={"cpu": 512, "memory": 256}))
>>> with sklearn_parallel_backend('civis'):
        gs.fit(digits.data, digits.target)
```

civis.parallel.make\_backend\_template\_factory(from\_template\_id, arguments=None, client=None, polling\_interval=None, max\_submit\_retries=0, max\_job\_retries=0, hidden=True)

Create a joblib backend factory that uses Civis Custom Scripts.

If your template has settable parameters "CIVIS\_PARENT\_JOB\_ID" and "CIVIS\_PARENT\_RUN\_ID", then this executor will fill them with the contents of the "CIVIS\_JOB\_ID" and "CIVIS\_RUN\_ID" of the environment which created them. If the code doesn't have "CIVIS\_JOB\_ID" and "CIVIS\_RUN\_ID" environment variables available, the child will not have "CIVIS\_PARENT\_JOB\_ID" and "CIVIS\_PARENT\_RUN\_ID" environment variables.

#### **Parameters**

**from\_template\_id:** int Create jobs as Custom Scripts from the given template ID. When using the joblib backend with templates, the template must have a very specific form. Refer to the documentation for details.

**arguments** [dict or None, optional] Dictionary of name/value pairs to use to run this script. Only settable if this script has defined params. See the *container scripts API documentation* <a href="https://platform.civisanalytics.com/api#resources-scripts">https://platform.civisanalytics.com/api#resources-scripts</a> for details.

**client** [civis.APIClient instance or None, optional] An API Client object to use.

**polling\_interval** [int, optional] The polling interval, in seconds, for checking container script status. If you have many jobs, you may want to set this higher (e.g., 300) to avoid *rate-limiting <a href="https://platform.civisanalytics.com/api#basics">https://platform.civisanalytics.com/api#basics</a>. You should only set this if you aren't using pubnub notifications.* 

max\_submit\_retries [int, optional] The maximum number of retries for submitting each job. This is to help avoid a large set of jobs failing because of a single 5xx error. A value higher than zero should only be used for jobs that are idempotent (i.e., jobs whose result and side effects are the same regardless of whether they are run once or many times).

max\_job\_retries [int, optional] Retry failed jobs this number of times before giving up. Even more than with max\_submit\_retries, this should only be used for jobs which are idempotent, as the job may have caused side effects (if any) before failing. These retries assist with jobs which may have failed because of network or worker failures.

**hidden: bool, optional** The hidden status of the object. Setting this to true hides it from most API endpoints. The object can still be queried directly by ID. Defaults to True.

# 6.5 API Client

APIClient is a class for handling requests to the Civis API. An instantiated APIClient contains a set of resources (listed below) where each resource is an object with methods. By convention, an instantiated APIClient object is named client and API requests are made with the following syntax:

```
client = civis.APIClient()
response = client.resource.method(params)
```

The methods on APIClient are created dynamically at runtime by parsing an collections.OrderedDict representation of the Civis API specification. By default, this specification is downloaded from the /endpoints endpoint the first time APIClient is instantiated (and cached in memory for the remainder of the program's run). In some circumstances, it may be useful to use a local cache of the API specification rather than downloading the spec. This can be done by passing the specification to the client through the parameter local\_api\_spec as either the collections.OrderedDict or a filename where the specification has been saved.

```
api_key = os.environ['CIVIS_API_KEY']
spec = civis.resources.get_api_spec(api_key)

# From OrderedDict
client = civis.APIClient(local_api_spec=spec)

# From file
with open('local_api_spec.json', 'w') as f:
    json.dump(spec, f)
client = civis.APIClient(local_api_spec='local_api_spec.json')
```

**class** civis.**APIClient** (api\_key=None, return\_type='snake', retry\_total=6, api\_version='1.0', resources='all', local\_api\_spec=None)

The Civis API client.

## Parameters

**api\_key** [str, optional] Your API key obtained from the Civis Platform. If not given, the client will use the CIVIS\_API\_KEY environment variable.

**return type** [str. optional] The following types are implemented:

- 'raw' Returns the raw requests. Response object.
- 'snake' Returns a *civis.response.Response* object for the json-encoded content of a response. This maps the top-level json keys to snake\_case.
- 'pandas' Returns a pandas. DataFrame for list-like responses and a pandas. Series for single a json response.

**retry\_total** [int, optional] A number indicating the maximum number of retries for 429, 502, 503, or 504 errors.

**api\_version** [string, optional] The version of endpoints to call. May instantiate multiple client objects with different versions. Currently only "1.0" is supported.

**resources** [string, optional] When set to "base", only the default endpoints will be exposed in the client object. Set to "all" to include all endpoints available for a given user, including those that may be in development and subject to breaking changes at a later date. This will be removed in a future version of the API client.

**local\_api\_spec** [collections.OrderedDict or string, optional] The methods on this class are dynamically built from the Civis API specification, which can be retrieved from the /endpoints endpoint. When local\_api\_spec is None, the default, this specification is downloaded the

first time APIClient is instantiated. Alternatively, a local cache of the specification may be passed as either an OrderedDict or a filename which points to a json file.

#### **Attributes**

```
announcements An instance of the Announcements endpoint
apps An instance of the Apps endpoint
clusters An instance of the Clusters endpoint
codes An instance of the Codes endpoint
credentials An instance of the Credentials endpoint
databases An instance of the Databases endpoint
endpoints An instance of the Endpoints endpoint
enhancements An instance of the Enhancements endpoint
exports An instance of the Exports endpoint
files An instance of the Files endpoint
groups An instance of the Groups endpoint
imports An instance of the Imports endpoint
jobs An instance of the Jobs endpoint
match targets An instance of the Match Targets endpoint

scripts An instance of the Scripts endpoint
search An instance of the Search endpoint
tables An instance of the Tables endpoint
templates An instance of the Templates endpoint
users An instance of the Users endpoint
workflows An instance of the Workflows endpoint
```

## default\_credential

The current user's default credential.

## get\_aws\_credential\_id

Find an AWS credential ID.

#### **Parameters**

**cred\_name** [str or int] If an integer ID is given, this passes through directly. If a str is given, return the ID corresponding to the AWS credential with that name.

**owner** [str, optional] Return the credential with this owner. If not provided, search for credentials under your username to disambiguate multiple credentials with the same name. Note that this function cannot return credentials which are not associated with an owner.

#### Returns

**aws\_credential\_id** [int] The ID number of the AWS credentials.

#### Raises

ValueError If the AWS credential can't be found.

## **Examples**

```
>>> import civis
>>> client = civis.APIClient()
>>> client.get_aws_credential_id('jsmith')
1234
```

```
>>> client.get_aws_credential_id(1111)
1111
```

## get\_database\_credential\_id

Return the credential ID for a given username in a given database.

## **Parameters**

**username** [str or int] If an integer ID is given, this passes through directly. If a str is given, return the ID corresponding to the database credential with that username.

**database\_name** [str or int] Return the ID of the database credential with username *user-name* for this database name or ID.

## Returns

database\_credential\_id [int] The ID of the database credentials.

## Raises

ValueError If the credential can't be found.

## **Examples**

```
>>> import civis
>>> client = civis.APIClient()
>>> client.get_database_credential_id('jsmith', 'redshift-general')
1234
```

```
>>> client.get_database_credential_id(1111, 'redshift-general')
1111
```

## get\_database\_id

Return the database ID for a given database name.

#### **Parameters**

**database** [str or int] If an integer ID is given, passes through. If a str is given the database ID corresponding to that database name is returned.

## Returns

database\_id [int] The ID of the database.

#### Raises

**ValueError** If the database can't be found.

## get\_table\_id

Return the table ID for a given database and table name.

#### **Parameters**

**table** [str] The name of the table in format schema.tablename. Either schema or tablename, or both, can be double-quoted to correctly parse special characters (such as '.').

database [str or int] The name or ID of the database.

#### **Returns**

table id [int] The ID of the table.

#### Raises

ValueError If a table match can't be found.

## **Examples**

```
>>> import civis
>>> client = civis.APIClient()
>>> client.get_table_id('foo.bar', 'redshift-general')
123
>>> client.get_table_id('"schema.has.periods".bar', 'redshift-general')
456
```

## username

The current user's username.

# 6.5.1 API Responses

## **Response Types**

**class** civis.response.**Response**(*json\_data*, *snake\_case=True*, *headers=None*)

Custom Civis response object.

#### **Notes**

The main features of this class are that it maps camelCase to snake\_case at the top level of the json object and attaches keys as attributes. Nested object keys are not changed.

## **Attributes**

**json\_data** [dict | None] This is *json\_data* as it is originally returned to the user without the key names being changed. See Notes. None is used if the original response returned a 204 No Content response.

**headers** [dict] This is the header for the API call without changing the key names.

**calls remaining** [int] Number of API calls remaining before rate limit is reached.

rate\_limit [int] Total number of calls per API rate limit period.

class civis.response.PaginatedResponse (path, initial\_params, endpoint)
A response object which is an iterator

#### **Parameters**

path [str] Make GET requests to this path.

**initial\_params** [dict] Query params that should be passed along with each request. Note that if *initial\_params* contains the keys *page\_num* or *limit*, they will be ignored. The given dict is not modified.

endpoint [civis.base.Endpoint] An endpoint used to make API requests.

#### **Notes**

This response is returned automatically by endpoints which support pagination when the *iterator* kwarg is specified.

## **Examples**

```
>>> client = civis.APIClient()
>>> queries = client.queries.list(iterator=True)
>>> for query in queries:
... print(query['id'])
```

A class for tracking future results.

This class will attempt to subscribe to a Pubnub channel to listen for job completion events. If you don't have access to Pubnub channels, then it will fallback to polling.

This is a subclass of concurrent.futures.Future from the Python standard library. See: https://docs.python.org/3/library/concurrent.futures.html

## **Parameters**

poller [func] A function which returns an object that has a state attribute.

**poller\_args** [tuple] The arguments with which to call the poller function.

**polling\_interval** [int or float, optional] The number of seconds between API requests to check whether a result is ready.

**api\_key** [DEPRECATED str, optional] Your Civis API key. If not given, the CIVIS\_API\_KEY environment variable will be used.

```
client [civis.APIClient, optional]
```

**poll\_on\_creation** [bool, optional] If True (the default), it will poll upon calling result () the first time. If False, it will wait the number of seconds specified in *polling\_interval* from object creation before polling.

## **Examples**

This example is provided as a function at query\_civis().

```
>>> client = civis.APIClient()
>>> database_id = client.get_database_id("my_database")
>>> cred_id = client.default_credential
>>> sql = "SELECT 1"
>>> preview_rows = 10
>>> response = client.queries.post(database_id, sql, preview_rows,
>>> credential=cred_id)
>>> job_id = response.id
>>>
>>> poller = client.queries.get
>>> poller_args = (job_id, ) # (job_id, run_id) if poller requires run_id
>>> polling_interval = 10
>>> future = CivisFuture(poller, poller_args, polling_interval)
```

## **Helper Functions**

```
civis.find(object_list, filter_func=None, **kwargs)
Filter civis.response.Response objects.
```

## Parameters

**object\_list** [iterable] An iterable of arbitrary objects, particularly those with attributes that can be targeted by the filters in *kwargs*. A major use case is an iterable of *civis.response*. *Response* objects.

**filter\_func** [callable, optional] A one-argument function. If specified, *kwargs* are ignored. An *object* from the input iterable is kept in the returned list if and only if bool(filter func(object)) is True.

- \*\*kwargs Key-value pairs for more fine-grained filtering; they cannot be used in conjunction with *filter\_func*. All keys must be strings. For an *object* from the input iterable to be included in the returned list, all the *key's must be attributes of 'object*, plus any one of the following conditions for a given *key*:
  - *value* is a one-argument function and bool(value(getattr(object, key))) is True
  - value is True
  - getattr (object, key) is equal to value

## Returns

list

## See also:

```
civis.find_one
```

## **Examples**

```
>>> import civis
>>> client = civis.APIClient()
>>> # creds is a list of civis.response.Response objects
>>> creds = client.credentials.list()
>>> # target_creds contains civis.response.Response objects
>>> # with the attribute 'name' == 'username'
>>> target_creds = find(creds, name='username')
```

## civis.find\_one (object\_list, filter\_func=None, \*\*kwargs)

Return one satisfying civis.response.Response object.

The arguments are the same as those for <code>civis.find()</code>. If more than one object satisfies the filtering criteria, the first one is returned. If no satisfying objects are found, <code>None</code> is returned.

#### Returns

object or None

#### See also:

civis.find

## 6.5.2 API Resources

## **Announcements**

class Announcements (session\_kwargs, return\_type='civis')

## **Methods**

\_\_\_\_

```
list (*, limit='DEFAULT', page_num='DEFAULT', order='DEFAULT', order_dir='DEFAULT', itera-
tor='DEFAULT')
List announcements
```

#### **Parameters**

**limit** [integer, optional] Number of results to return. Defaults to 10. Maximum allowed is 50.

page\_num [integer, optional] Page number of the results to return. Defaults to the first page,

**order** [string, optional] The field on which to order the result set. Defaults to released\_at. Must be one of: released\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

iterator [bool, optional] If True, return a generator to iterate over all responses. Use when

more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### **Returns**

```
id [integer] The ID of this announcement
subject [string] The subject of this announcement.
body [string] The body of this announcement.
released_at [string/date-time] The date and time this announcement was released.
created_at [string/date-time]
updated_at [string/date-time]
```

## **Apps**

```
class Apps (session_kwargs, return_type='civis')
```

#### **Methods**

 ${\tt delete\_instances\_projects} (id, project\_id, slug)$ 

Remove a AppInstance from a project

## **Parameters**

```
id [integer] The ID of the resource.project_id [integer] The ID of the project.slug [string] The slug for the application.
```

## Returns

None Response code 204: success

## delete\_instances\_shares\_groups (slug, id, group\_id)

Revoke the permissions a group has on this object

#### **Parameters**

```
slug [string] The slug for the application.id [integer] The ID of the resource that is shared.group_id [integer] The ID of the group.Returns
```

None Response code 204: success

## delete\_instances\_shares\_users (slug, id, user\_id)

Revoke the permissions a user has on this object

## **Parameters**

```
slug [string] The slug for the application.id [integer] The ID of the resource that is shared.user_id [integer] The ID of the user.
```

#### Returns

```
None Response code 204: success
```

# $\verb"delete_releases_shares_groups" (slug, id, group\_id)$

Revoke the permissions a group has on this object

#### **Parameters**

**slug** [string] The slug for the application.

id [integer] The ID of the resource that is shared.

group\_id [integer] The ID of the group.

#### Returns

None Response code 204: success

# ${\tt delete\_releases\_shares\_users} \ (\mathit{slug}, \mathit{id}, \mathit{user\_id})$

Revoke the permissions a user has on this object

#### **Parameters**

**slug** [string] The slug for the application.

id [integer] The ID of the resource that is shared.

user\_id [integer] The ID of the user.

## Returns

None Response code 204: success

#### get (slug)

List details of a Decision Application

## **Parameters**

**slug** [string] The slug for the application.

#### **Returns**

**slug** [string] The slug for the application.

id [integer] The unique id of the application.

instance\_name [string] A word that describes an instance of this app.

**name** [string] The name of the application.

current\_release [dict::]

- id [integer] The unique id of the release.
- app\_id [integer] The id of the app the release belongs to.
- report\_template\_id [integer] ID of the report template for this release.
- resources [dict] A hash of resources associated with this release.
- archived [string] The archival status of the requested item(s).

features [dict] App features.

## get\_instances (id, slug)

Return a given app instance

#### **Parameters**

id [integer] The unique id of the instance.

```
slug [string] The slug for the application.
           Returns
                id [integer] The unique id of the instance.
                name [string] The name of the instance.
                app_release_id [integer] The id of the app release the instance belongs to.
                report_id [integer] The id of the report the instance belongs to.
                created_at [string/time] The time the instance was created at.
                user [dict::]
                    • id [integer] The ID of this user.
                    • name [string] This user's name.
                    • username [string] This user's username.
                    • initials [string] This user's initials.
                    • online [boolean] Whether this user is online.
                project_id [integer] The id of the project collecting all the items that belong to this app
                    instance.
                auth_code_url [string]
                api_key [string] A Civis API key that can be used by this app instance.
                archived [string] The archival status of the requested item(s).
get_releases (id, slug)
      Return a given app release
           Parameters
                id [integer] The unique id of the release.
                slug [string] The slug for the application.
           Returns
                id [integer] The unique id of the release.
                app_id [integer] The id of the app the release belongs to.
                report template id [integer] ID of the report template for this release.
                resources [dict] A hash of resources associated with this release.
                archived [string] The archival status of the requested item(s).
list()
      List apps
           Returns
                slug [string] The slug for the application.
                id [integer] The unique id of the application.
                instance_name [string] A word that describes an instance of this app.
                name [string] The name of the application.
```

List the instances of a Decision Application

#### **Parameters**

**slug** [string] The slug for the application.

**archived** [string, optional] The archival status of the requested item(s).

app\_release\_id [integer, optional] If supplied, return only instances matching this release.

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The unique id of the instance.

**name** [string] The name of the instance.

app\_release\_id [integer] The id of the app release the instance belongs to.

report\_id [integer] The id of the report the instance belongs to.

created\_at [string/time] The time the instance was created at.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

project\_id [integer] The id of the project collecting all the items that belong to this app
instance.

**archived** [string] The archival status of the requested item(s).

list\_instances\_projects (id, slug, \*, hidden='DEFAULT')

List the projects a AppInstance belongs to

## **Parameters**

id [integer] The ID of the resource.

slug [string] The slug for the application.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

#### Returns

```
id [integer] The ID for this project.
```

```
author [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

name [string] The name of this project.

**description** [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

```
auto_share [boolean]
created_at [string/time]
updated_at [string/time]
archived [string] The archival status of the requested item(s).
```

#### list\_instances\_shares (slug, id)

List users and groups permissioned on this object

## **Parameters**

```
slug [string] The slug for the application.
```

id [integer] The ID of the resource that is shared.

## Returns

```
readers [dict::]
users [list::]
id: integer
name: string
groups [list::]
id: integer
name: string
```

writers [dict::]

```
users [list::]
id: integer
name: string
groups [list::]
id: integer
name: string
owners [dict::]
users [list::]
id: integer
name: string
groups [list::]
id: integer
```

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

list\_releases (slug, \*, archived='DEFAULT', limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')
List the releases of a particular Decision Application

## **Parameters**

```
slug [string] The slug for the application.
```

- name: string

**archived** [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

id [integer] The unique id of the release.

**app\_id** [integer] The id of the app the release belongs to.

**report\_template\_id** [integer] ID of the report template for this release.

resources [dict] A hash of resources associated with this release.

archived [string] The archival status of the requested item(s).

```
list_releases_shares (slug, id)
      List users and groups permissioned on this object
            Parameters
                 slug [string] The slug for the application.
                 id [integer] The ID of the resource that is shared.
            Returns
                 readers [dict::]
                        • users [list::]
                            - id: integer
                            - name: string
                        • groups [list::]
                            - id: integer
                            - name: string
                 writers [dict::]
                        • users [list::]
                            - id: integer
                            - name: string
                        • groups [list::]
                            - id: integer
                            - name: string
                 owners [dict::]
                        • users [list::]
                            - id: integer
                            - name: string
                        • groups [list::]
                            - id: integer
                            - name: string
                 total user shares [integer] For owners, the number of total users shared. For writers
                      and readers, the number of visible users shared.
                 total_group_shares [integer] For owners, the number of total groups shared. For writ-
                      ers and readers, the number of visible groups shared.
patch_instances (id, slug, *, name='DEFAULT')
      Update a given app instance
            Parameters
                 id [integer] The unique id of the instance.
                 slug [string] The slug for the application.
```

name [string, optional] The name of the instance.

#### **Returns**

```
id [integer] The unique id of the instance.
                  name [string] The name of the instance.
                  app_release_id [integer] The id of the app release the instance belongs to.
                  report id [integer] The id of the report the instance belongs to.
                  created at [string/time] The time the instance was created at.
                  user [dict::]
                        • id [integer] The ID of this user.
                        • name [string] This user's name.
                        • username [string] This user's username.
                        • initials [string] This user's initials.
                        • online [boolean] Whether this user is online.
                  project_id [integer] The id of the project collecting all the items that belong to this app
                      instance.
                 auth_code_url [string]
                 api_key [string] A Civis API key that can be used by this app instance.
                 archived [string] The archival status of the requested item(s).
patch_releases (slug, id, *, report_template_id='DEFAULT', resources='DEFAULT')
      Update an existing Decision Application release
            Parameters
                 slug [string] The slug for the application.
                  id [integer] The unique id of the release.
                  report_template_id [integer, optional] ID of the report template for this release.
                  resources [dict, optional] A hash of resources associated with this release.
            Returns
                  id [integer] The unique id of the release.
                  app_id [integer] The id of the app the release belongs to.
                  report template id [integer] ID of the report template for this release.
                  resources [dict] A hash of resources associated with this release.
                 archived [string] The archival status of the requested item(s).
post_instances (slug, *, name='DEFAULT')
      Create a new instance of an application of the given slug
            Parameters
                 slug [string] The slug for the application.
                  name [string, optional] The name of the instance.
```

id [integer] The unique id of the instance.

Returns

```
name [string] The name of the instance.
                  app_release_id [integer] The id of the app release the instance belongs to.
                  report_id [integer] The id of the report the instance belongs to.
                  created_at [string/time] The time the instance was created at.
                  user [dict::]
                        • id [integer] The ID of this user.
                        • name [string] This user's name.
                        • username [string] This user's username.
                        • initials [string] This user's initials.
                        • online [boolean] Whether this user is online.
                  project_id [integer] The id of the project collecting all the items that belong to this app
                      instance.
                  auth code url [string]
                  api_key [string] A Civis API key that can be used by this app instance.
                 archived [string] The archival status of the requested item(s).
post_releases (slug, report_template_id, resources)
      Create a new Decision Application release
            Parameters
                 slug [string] The slug for the application.
                  report_template_id [integer] ID of the report template for this release.
                  resources [dict] A hash of resources associated with this release.
            Returns
                 id [integer] The unique id of the release.
                 app_id [integer] The id of the app the release belongs to.
                  report_template_id [integer] ID of the report template for this release.
                  resources [dict] A hash of resources associated with this release.
                  archived [string] The archival status of the requested item(s).
put features (slug, org, features)
      Update the Decision Application features for a given organization
            Parameters
                  slug [string] The slug for the application.
                  org [string] Organization.
                 features [dict] App features.
            Returns
                 slug [string] The slug for the application.
                 id [integer] The unique id of the application.
                  instance_name [string] A word that describes an instance of this app.
```

```
current_release [dict::]
                        • id [integer] The unique id of the release.
                        • app_id [integer] The id of the app the release belongs to.
                        • report template id [integer] ID of the report template for this release.
                         • resources [dict] A hash of resources associated with this release.
                        • archived [string] The archival status of the requested item(s).
                 features [dict] App features.
put_instances_archive (id, slug, status)
      Update the archive status of this object
            Parameters
                 id [integer] The ID of the object.
                 slug [string] The slug for the application.
                 status [boolean] The desired archived status of the object.
            Returns
                 id [integer] The unique id of the instance.
                 name [string] The name of the instance.
                  app_release_id [integer] The id of the app release the instance belongs to.
                  report_id [integer] The id of the report the instance belongs to.
                 created_at [string/time] The time the instance was created at.
                  user [dict::]
                        • id [integer] The ID of this user.
                        • name [string] This user's name.
                        • username [string] This user's username.
                        • initials [string] This user's initials.
                        • online [boolean] Whether this user is online.
                 project_id [integer] The id of the project collecting all the items that belong to this app
                      instance.
                  auth_code_url [string]
                 api_key [string] A Civis API key that can be used by this app instance.
                 archived [string] The archival status of the requested item(s).
put_instances_projects (id, project_id, slug)
      Add a AppInstance to a project
            Parameters
                 id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
                  slug [string] The slug for the application.
```

**name** [string] The name of the application.

```
Returns
                 None Response code 204: success
                                                     id,
put_instances_shares_groups (slug,
                                                                                   permission_level,
                                                                 group_ids,
                                                                     share_email_body='DEFAULT',
                                        send_shared_email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                 slug [string] The slug for the application.
                 id [integer] The ID of the resource that is shared.
                 group_ids [list] An array of one or more group IDs.
                 permission_level [string] Options are: "read", "write", or "manage".
                 share_email_body [string, optional] Custom body text for e-mail sent on a share.
                 send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                 readers [dict::]
                        • users [list::]
                            - id: integer
                            - name: string
                        • groups [list::]
                            - id: integer
                            - name: string
                 writers [dict::]
                       • users [list::]
                            - id: integer
                            - name: string
                        • groups [list::]
                            - id: integer
                            - name: string
                 owners [dict::]
                        • users [list::]
                            - id: integer
                            - name: string
                        • groups [list::]
```

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

id : integername : string

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

```
\begin{tabular}{lll} \textbf{put\_instances\_shares\_users} (slug, & id, & user\_ids, & permission\_level, \\ & *, & share\_email\_body='DEFAULT', \\ & send\_shared\_email='DEFAULT') \\ & Set the permissions users have on this object \\ \end{tabular}
```

# **Parameters**

```
slug [string] The slug for the application.
id [integer] The ID of the resource that is shared.
user_ids [list] An array of one or more user IDs.
permission_level [string] Options are: "read", "write", or "manage".
share_email_body [string, optional] Custom body text for e-mail sent on a share.
send_shared_email [boolean, optional] Send email to the recipients of a share.
```

## **Returns**

```
readers [dict::]
      • users [list::]
           - id: integer
           - name: string
      • groups [list::]
           - id: integer
           - name: string
writers [dict::]
      • users [list::]
           - id: integer
           - name: string
      • groups [list::]
           - id: integer
           - name: string
owners [dict::]
      • users [list::]
           - id: integer
           - name: string
      • groups [list::]
           - id: integer
           - name: string
```

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

```
ers and readers, the number of visible groups shared.
put_releases_archive (id, slug, status)
      Update the archive status of this object
            Parameters
                 id [integer] The ID of the object.
                 slug [string] The slug for the application.
                 status [boolean] The desired archived status of the object.
            Returns
                 id [integer] The unique id of the release.
                 app_id [integer] The id of the app the release belongs to.
                 report_template_id [integer] ID of the report template for this release.
                 resources [dict] A hash of resources associated with this release.
                 archived [string] The archival status of the requested item(s).
put_releases_shares_groups (slug,
                                                     id.
                                                                 group_ids,
                                                                                     permission_level,
                                                                      share email body='DEFAULT',
                                       send_shared_email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                 slug [string] The slug for the application.
                 id [integer] The ID of the resource that is shared.
                 group_ids [list] An array of one or more group IDs.
                 permission_level [string] Options are: "read", "write", or "manage".
                 share_email_body [string, optional] Custom body text for e-mail sent on a share.
                 send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                 readers [dict::]
                        • users [list::]
                            - id: integer
                            - name: string

```
- id: integer
                            - name : string
                 owners [dict::]
                        • users [list::]
                            - id: integer
                            - name: string
                        • groups [list::]
                            - id: integer
                            - name: string
                 total_user_shares [integer] For owners, the number of total users shared. For writers
                      and readers, the number of visible users shared.
                 total_group_shares [integer] For owners, the number of total groups shared. For writ-
                      ers and readers, the number of visible groups shared.
put_releases_shares_users (slug,
                                                     id,
                                                                 user_ids,
                                                                                     permission_level,
                                                                      share_email_body='DEFAULT',
                                      send_shared_email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                 slug [string] The slug for the application.
                 id [integer] The ID of the resource that is shared.
                 user_ids [list] An array of one or more user IDs.
                 permission_level [string] Options are: "read", "write", or "manage".
                 share_email_body [string, optional] Custom body text for e-mail sent on a share.
                 send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                 readers [dict::]
                        • users [list::]
                            - id: integer
                            - name: string
                        • groups [list::]
                            - id: integer
                            - name: string
                 writers [dict::]
                        • users [list::]
                            - id: integer
                            - name: string
                        • groups [list::]
```

6.5. API Client 73

- id: integer

```
- name: string
                       owners [dict::]
                              • users [list::]
                                  - id: integer
                                  - name: string
                              groups [list::]
                                  - id: integer
                                  - name: string
                       total_user_shares [integer] For owners, the number of total users shared. For writers
                            and readers, the number of visible users shared.
                       total_group_shares [integer] For owners, the number of total groups shared. For writ-
                            ers and readers, the number of visible groups shared.
class Clusters (session_kwargs, return_type='civis')
      delete_kubernetes_partitions (id, cluster_partition_id)
            Delete a Cluster Partition
                  Parameters
                       id [integer] The ID of the cluster which this partition belongs to.
                       cluster_partition_id [integer] The ID of this cluster partition.
                  Returns
                       None Response code 204: success
      get kubernetes (id)
            Describe a Kubernetes Cluster
                  Parameters
                       id [integer] The ID of this cluster.
                  Returns
                       id [integer] The ID of this cluster.
                       organization_id [string] The id of this cluster's organization.
                       organization_name [string] The name of this cluster's organization.
                       organization_slug [string] The slug of this cluster's organization.
                       cluster_partitions [list::] List of cluster partitions associated with this cluster. - clus-
                            ter_partition_id: integer
                                The ID of this cluster partition.
```

Clusters

**Methods** 

- name [string] The name of the cluster partition.
- labels [list] Labels associated with this partition.
- **instance\_configs** [list::] The instances configured for this cluster partition. instance\_config\_id: integer

The ID of this InstanceConfig.

- **instance\_type** [string] An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.
- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.
- **instance\_max\_memory** [integer] The amount of memory (RAM) available to a single instance of that type in megabytes.
- instance\_max\_cpu [integer] The number of processor shares available to a single instance of that type in millicores.
- instance\_max\_disk [integer] The amount of disk available to a single instance of that type in gigabytes.
- **default\_instance\_config\_id** [integer] The id of the InstanceConfig that is the default for this partition.

**is\_nat\_enabled** [boolean] Whether this cluster needs a NAT gateway or not.

get\_kubernetes\_partitions (id, cluster\_partition\_id)

Describe a Cluster Partition

#### **Parameters**

id [integer] The ID of the cluster which this partition belongs to.

**cluster\_partition\_id** [integer] The ID of this cluster partition.

## Returns

cluster\_partition\_id [integer] The ID of this cluster partition.

name [string] The name of the cluster partition.

**labels** [list] Labels associated with this partition.

 $\begin{tabular}{ll} \textbf{instance\_configs} & [list::] & The instances configured for this cluster partition. & -instance\_config\_id: integer \\ \end{tabular}$ 

The ID of this InstanceConfig.

- instance\_type [string] An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.
- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.

- **instance\_max\_memory** [integer] The amount of memory (RAM) available to a single instance of that type in megabytes.
- **instance\_max\_cpu** [integer] The number of processor shares available to a single instance of that type in millicores.
- instance\_max\_disk [integer] The amount of disk available to a single instance of that type in gigabytes.

**default\_instance\_config\_id** [integer] The id of the InstanceConfig that is the default for this partition.

# get\_workers(id)

Describe a Worker Cluster

#### **Parameters**

id [integer] The ID of this cluster.

## Returns

id [integer] The ID of this cluster.

**instance\_type** [string] The EC2 instance types in this cluster.

min\_instances [integer] The minimum number of instances in this cluster.

max\_instances [integer] The maximum number of instances in this cluster.

**instances** [integer] The number of instances currently in this cluster.

instance\_max\_memory [integer] The amount of memory available to a single instance.

**instance\_max\_cpu** [integer] The number of processor shares available to a single instance.

**instance\_max\_disk\_space** [number/float] The amount of memory available to a single instance.

**region** [string] The AWS region that this cluster is in.

active\_jobs\_count [integer] The number of jobs currently being run in the cluster.

queued\_jobs\_count [integer] The number of jobs currently waiting to be run on the cluster.

## **Parameters**

**organization\_slug** [string, optional] The slug of this cluster's organization.

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to organization\_id. Must be one of: organization\_id, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

id [integer] The ID of this cluster.

**organization\_id** [string] The id of this cluster's organization.

**organization\_name** [string] The name of this cluster's organization.

organization\_slug [string] The slug of this cluster's organization.

**cluster\_partitions** [list::] List of cluster partitions associated with this cluster. - cluster\_partition\_id: integer

The ID of this cluster partition.

- name [string] The name of the cluster partition.
- labels [list] Labels associated with this partition.
- instance\_configs [list::] The instances configured for this cluster partition.
  - instance config id: integer

The ID of this InstanceConfig.

- **instance\_type** [string] An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.
- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.
- **instance\_max\_memory** [integer] The amount of memory (RAM) available to a single instance of that type in megabytes.
- instance\_max\_cpu [integer] The number of processor shares available to a single instance of that type in millicores.
- instance\_max\_disk [integer] The amount of disk available to a single instance of that type in gigabytes.
- **default\_instance\_config\_id** [integer] The id of the InstanceConfig that is the default for this partition.

**is\_nat\_enabled** [boolean] Whether this cluster needs a NAT gateway or not.

# $list_kubernetes_deployment_stats(id)$

Get stats about deployments associated with a Kubernetes Cluster

## **Parameters**

id [integer] The ID of this cluster.

# Returns

base\_type [string] The base type of this deployment
state [string] State of the deployment

**count** [integer] Number of deployments of base type and state

total\_cpu [integer] Total amount of CPU in millicores for deployments of base type and state

**total\_memory** [integer] Total amount of Memory in megabytes for deployments of base type and state

List the deployments associated with a Kubernetes Cluster

## **Parameters**

id [integer] The id of the cluster.

**base\_type** [string, optional] If specified, return deployments of these base types. It accepts a comma-separated list, possible values are 'Notebook', 'Service', 'Run'.

**state** [string, optional] If specified, return deployments in these states. It accepts a comma-separated list, possible values are pending, running, terminated, sleeping

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to created\_at. Must be one of: created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

id [integer] The id of this deployment.

name [string] The name of the deployment.

base\_id [integer] The id of the base object associated with the deployment.

base type [string] The base type of this deployment.

state [string] The state of the deployment.

cpu [integer] The CPU in millicores required by the deployment.

memory [integer] The memory in MB required by the deployment.

disk\_space [integer] The disk space in GB required by the deployment.

**instance\_type** [string] The EC2 instance type requested for the deployment.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.

• **online** [boolean] Whether this user is online.

created\_at [string/time]

updated\_at [string/time]

# list\_kubernetes\_partitions (id)

List Cluster Partitions for given cluster

## **Parameters**

id [integer] The ID of this cluster.

## **Returns**

cluster\_partition\_id [integer] The ID of this cluster partition.

**name** [string] The name of the cluster partition.

labels [list] Labels associated with this partition.

**instance\_configs** [list::] The instances configured for this cluster partition. - instance\_config\_id: integer

The ID of this InstanceConfig.

- instance\_type [string] An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.
- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.
- **instance\_max\_memory** [integer] The amount of memory (RAM) available to a single instance of that type in megabytes.
- **instance\_max\_cpu** [integer] The number of processor shares available to a single instance of that type in millicores.
- instance\_max\_disk [integer] The amount of disk available to a single instance of that type in gigabytes.

**default\_instance\_config\_id** [integer] The id of the InstanceConfig that is the default for this partition.

# **Parameters**

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

order [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

```
id [integer] The ID of this cluster.
instance_type [string] The EC2 instance types in this cluster.
min_instances [integer] The minimum number of instances in this cluster.
max_instances [integer] The maximum number of instances in this cluster.
region [string] The AWS region that this cluster is in.
active_jobs_count [integer] The number of jobs currently being run in the cluster.
queued_jobs_count [integer] The number of jobs currently waiting to be run on the cluster.
```

## list\_workers\_active\_jobs(id)

List Active Jobs for a Worker Cluster

# **Parameters**

id [integer] The ID of this cluster.

## Returns

- The time that the run was queued.
- **finished at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

• **started\_at** [string/time] The time that the run started.

# last\_run [dict::]

- id : integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

```
hidden [boolean] The hidden status of the item.
                  required_cpu [integer] The CPU shares required by the script.
                  required_disk_space [integer] The disk space in GB required by the script.
                  required_memory [integer] The memory in MB required by the script.
                  author [dict::]
                          • id [integer] The ID of this user.
                          • name [string] This user's name.
                          • username [string] This user's username.
                          • initials [string] This user's initials.
                          • online [boolean] Whether this user is online.
                  running_as [dict::]
                          • id [integer] The ID of this user.
                          • name [string] This user's name.
                          • username [string] This user's username.
                          • initials [string] This user's initials.
                          • online [boolean] Whether this user is online.
list_workers_queued_jobs(id)
     List Oueued Jobs for a Worker Cluster
            Parameters
                  id [integer] The ID of this cluster.
            Returns
                  id [integer]
                  name [string]
                  type [string]
                  from_template_id [integer]
                  state [string] Whether the job is idle, queued, running, cancelled, or failed.
                  created_at [string/date-time]
                  updated at [string/date-time]
                  runs [list::] Information about the most recent runs of the job. - id : integer - state :
                        string - created_at : string/time
                            The time that the run was queued.
                          • started_at [string/time] The time that the run started.
                          • finished_at [string/time] The time that the run completed.
                          • error [string] The error message for this run, if present.
                  last_run [dict::]
                          • id: integer
```

- state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

required\_cpu [integer] The CPU shares required by the script.

required\_disk\_space [integer] The disk space in GB required by the script.

**required\_memory** [integer] The memory in MB required by the script.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

patch\_kubernetes (id, \*, is\_nat\_enabled='DEFAULT')

Update a Kubernetes Cluster

# **Parameters**

id [integer] The ID of this cluster.

**is\_nat\_enabled** [boolean, optional] Whether this cluster needs a NAT gateway or not.

#### Returns

id [integer] The ID of this cluster.

**organization\_id** [string] The id of this cluster's organization.

organization\_name [string] The name of this cluster's organization.

organization\_slug [string] The slug of this cluster's organization.

**cluster\_partitions** [list::] List of cluster partitions associated with this cluster. - cluster\_partition\_id: integer

The ID of this cluster partition.

- name [string] The name of the cluster partition.
- labels [list] Labels associated with this partition.

• instance\_configs [list::] The instances configured for this cluster partition.

- instance\_config\_id : integer

The ID of this InstanceConfig.

- **instance\_type** [string] An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.
- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.
- **instance\_max\_memory** [integer] The amount of memory (RAM) available to a single instance of that type in megabytes.
- instance\_max\_cpu [integer] The number of processor shares available to a single instance of that type in millicores.
- instance\_max\_disk [integer] The amount of disk available to a single instance of that type in gigabytes.
- **default\_instance\_config\_id** [integer] The id of the InstanceConfig that is the default for this partition.

is\_nat\_enabled [boolean] Whether this cluster needs a NAT gateway or not.

Update a Cluster Partition

# **Parameters**

id [integer] The ID of the cluster which this partition belongs to.

**cluster\_partition\_id** [integer] The ID of this cluster partition.

instance\_configs [list, optional::] The instances configured for this cluster partition. instance\_type : string

An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.

- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.

**name** [string, optional] The name of the cluster partition.

labels [list, optional] Labels associated with this partition.

#### Returns

**cluster\_partition\_id** [integer] The ID of this cluster partition.

**name** [string] The name of the cluster partition.

labels [list] Labels associated with this partition.

**instance\_configs** [list::] The instances configured for this cluster partition. - instance\_config\_id: integer

The ID of this InstanceConfig.

- instance\_type [string] An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.
- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.
- **instance\_max\_memory** [integer] The amount of memory (RAM) available to a single instance of that type in megabytes.
- **instance\_max\_cpu** [integer] The number of processor shares available to a single instance of that type in millicores.
- instance\_max\_disk [integer] The amount of disk available to a single instance of that type in gigabytes.

**default\_instance\_config\_id** [integer] The id of the InstanceConfig that is the default for this partition.

```
post_kubernetes (*, organization_id='DEFAULT', organization_slug='DEFAULT', is_nat_enabled='DEFAULT')

Create a Kubernetes Cluster
```

### **Parameters**

organization\_id [string, optional] The id of this cluster's organization.

organization\_slug [string, optional] The slug of this cluster's organization.

**is\_nat\_enabled** [boolean, optional] Whether this cluster needs a NAT gateway or not.

# Returns

id [integer] The ID of this cluster.

organization\_id [string] The id of this cluster's organization.

**organization name** [string] The name of this cluster's organization.

**organization slug** [string] The slug of this cluster's organization.

**cluster\_partitions** [list::] List of cluster partitions associated with this cluster. - cluster\_partition\_id: integer

The ID of this cluster partition.

- name [string] The name of the cluster partition.
- labels [list] Labels associated with this partition.
- instance\_configs [list::] The instances configured for this cluster partition.
  - instance\_config\_id : integer

The ID of this InstanceConfig.

- **instance\_type** [string] An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.
- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.
- instance\_max\_memory [integer] The amount of memory (RAM) available to a single instance of that type in megabytes.
- instance\_max\_cpu [integer] The number of processor shares available to a single instance of that type in millicores.
- instance\_max\_disk [integer] The amount of disk available to a single instance of that type in gigabytes.
- default\_instance\_config\_id [integer] The id of the InstanceConfig that is
  the default for this partition.

is nat enabled [boolean] Whether this cluster needs a NAT gateway or not.

post\_kubernetes\_partitions (id, instance\_configs, name, labels)

Create a Cluster Partition for given cluster

#### **Parameters**

id [integer] The ID of the cluster which this partition belongs to.

instance\_configs [list::] The instances configured for this cluster partition. - instance\_type : string

An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.

- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.

name [string] The name of the cluster partition.

labels [list] Labels associated with this partition.

## **Returns**

**cluster\_partition\_id** [integer] The ID of this cluster partition.

**name** [string] The name of the cluster partition.

labels [list] Labels associated with this partition.

**instance\_configs** [list::] The instances configured for this cluster partition. - instance\_config\_id: integer

The ID of this InstanceConfig.

• instance\_type [string] An EC2 instance type. Possible values include t2.large, m4.xlarge, m4.2xlarge, m4.4xlarge, m5.12xlarge, and p2.xlarge.

- min\_instances [integer] The minimum number of instances of that type in this cluster.
- max\_instances [integer] The maximum number of instances of that type in this cluster.
- **instance\_max\_memory** [integer] The amount of memory (RAM) available to a single instance of that type in megabytes.
- **instance\_max\_cpu** [integer] The number of processor shares available to a single instance of that type in millicores.
- **instance\_max\_disk** [integer] The amount of disk available to a single instance of that type in gigabytes.

**default\_instance\_config\_id** [integer] The id of the InstanceConfig that is the default for this partition.

### Codes

```
class Codes (session_kwargs, return_type='civis')
```

## **Methods**

 $\mathtt{delete}\,(id)$ 

Delete a code

## **Parameters**

id [integer] The ID for this code.

## **Returns**

None Response code 204: success

get (id)

Show basic code info

# **Parameters**

id [integer] The ID for this code.

## Returns

id [integer] The ID for this code.

name [string] Name of code.

**type** [string] The code's type; e.g., Code::FrontEnd.

body [string] Actual code contents; e.g., HTML, SQL, etc.

**readme** [string] User specified information about this code. Markdown format accepted.

score [integer] Internal Civis Use Only.

auth\_s3\_url [string] Authorized\_s3\_link to file.

created\_at [string/time] The creation time for this code.

**updated\_at** [string/time] The last modification time for this code.

```
list (*, limit='DEFAULT', type='DEFAULT', featured='DEFAULT')
     List codes
           Parameters
                 limit [integer, optional] The maximum number of codes to return.
                 type [string, optional] The code's type; e.g., Code::FrontEnd.
                 featured [boolean, optional] If true, return featured codes.
           Returns
                 id [integer] The ID for this code.
                 name [string] Name of code.
                 type [string] The code's type; e.g., Code::FrontEnd.
                 created_at [string/time] The creation time for this code.
                 updated_at [string/time] The last modification time for this code.
patch(id, *, name='DEFAULT', type='DEFAULT', body='DEFAULT', readme='DEFAULT',
        score='DEFAULT', auth_s3_url='DEFAULT')
      Update a code
           Parameters
                 id [integer] The ID for this code.
                 name [string, optional] Name of code.
                 type [string, optional] The code's type; e.g., Code::FrontEnd.
                 body [string, optional] Actual code contents; e.g., HTML, SQL, etc.
                 readme [string, optional] User specified information about this code. Markdown for-
                       mat accepted.
                 score [integer, optional] Internal Civis Use Only.
                 auth_s3_url [string, optional] Authorized_s3_link to file.
           Returns
                 None Response code 204: success
post (name, type, body, readme, *, score='DEFAULT', auth_s3_url='DEFAULT')
      Create a new code
           Parameters
                 name [string] Name of code.
                 type [string] The code's type; e.g., Code::FrontEnd.
                 body [string] Actual code contents; e.g., HTML, SQL, etc.
                 readme [string] User specified information about this code. Markdown format ac-
                       cepted.
                 score [integer, optional] Internal Civis Use Only.
                 auth_s3_url [string, optional] Authorized_s3_link to file.
            Returns
                 None Response code 204: success
put (id, name, type, body, readme, *, score='DEFAULT', auth_s3_url='DEFAULT')
      Update a code
```

# **Parameters**

```
id [integer] The ID for this code.
```

name [string] Name of code.

**type** [string] The code's type; e.g., Code::FrontEnd.

body [string] Actual code contents; e.g., HTML, SQL, etc.

**readme** [string] User specified information about this code. Markdown format accepted.

**score** [integer, optional] Internal Civis Use Only.

auth\_s3\_url [string, optional] Authorized\_s3\_link to file.

#### **Returns**

id [integer] The ID for this code.

name [string] Name of code.

type [string] The code's type; e.g., Code::FrontEnd.

body [string] Actual code contents; e.g., HTML, SQL, etc.

**readme** [string] User specified information about this code. Markdown format accepted.

**score** [integer] Internal Civis Use Only.

auth\_s3\_url [string] Authorized\_s3\_link to file.

created\_at [string/time] The creation time for this code.

updated\_at [string/time] The last modification time for this code.

# Credentials

class Credentials (session\_kwargs, return\_type='civis')

# **Methods**

\_\_\_

# delete\_shares\_groups (id, group\_id)

Revoke the permissions a group has on this object

# **Parameters**

id [integer] The ID of the resource that is shared.

group\_id [integer] The ID of the group.

## Returns

None Response code 204: success

# delete\_shares\_users (id, user\_id)

Revoke the permissions a user has on this object

# **Parameters**

id [integer] The ID of the resource that is shared.

**user\_id** [integer] The ID of the user.

#### Returns

None Response code 204: success

get (id)

Get a credential

#### **Parameters**

id [integer] The ID of the credential.

## **Returns**

id [integer] The ID of the credential.

name [string] The name identifying the credential

type [string] The credential's type.

**username** [string] The username for the credential.

**description** [string] A long description of the credential.

**owner** [string] The name of the user who this credential belongs to.

remote\_host\_id [integer] The ID of the remote host associated with this credential.

**remote\_host\_name** [string] The name of the remote host associated with this credential.

state [string] The U.S. state for the credential. Only for VAN credentials.

created\_at [string/time] The creation time for this credential.

updated\_at [string/time] The last modification time for this credential.

## **Parameters**

type [string, optional] The type (or types) of credentials to return. One or more of: Amazon Web Services S3, Bitbucket, BSD::API, CASS/NCOA PAF, Catalist::API, Catalist::SFTP, Certificate, Civis Platform, Custom, Database, Google, Github, JobTraits::Ftp, Salesforce User, Salesforce Client, Silverpop Application, Silverpop Refresh Token, Silverpop User, TableauUser, VAN::MyVoterFile, VAN::MyCampaign, and VAN::BothModes. Specify multiple values as a comma-separated list (e.g., "A,B").

**default** [boolean, optional] If true, will return a list with a single credential which is the current user's default credential.

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 1000.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

order [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, created\_at, name.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

# Returns

```
id [integer] The ID of the credential.
```

name [string] The name identifying the credential

type [string] The credential's type.

**username** [string] The username for the credential.

**description** [string] A long description of the credential.

**owner** [string] The name of the user who this credential belongs to.

remote\_host\_id [integer] The ID of the remote host associated with this credential.

**remote\_host\_name** [string] The name of the remote host associated with this credential.

**state** [string] The U.S. state for the credential. Only for VAN credentials.

created\_at [string/time] The creation time for this credential.

updated\_at [string/time] The last modification time for this credential.

## list\_shares(id)

List users and groups permissioned on this object

#### **Parameters**

id [integer] The ID of the resource that is shared.

# Returns

```
readers [dict::]
```

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id: integer
  - name : string

## writers [dict::]

- users [list::]
  - id: integer
  - name : string
- groups [list::]
  - id: integer
  - name: string

# owners [dict::]

- users [list::]
  - id : integer

```
• groups [list::]
                                - id: integer
                                - name: string
                  total user shares [integer] For owners, the number of total users shared. For writers
                       and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.
                                           *, name='DEFAULT', description='DEFAULT',
                             password,
post (type,
       mote_host_id='DEFAULT', state='DEFAULT', system_credential='DEFAULT')
      Create a credential
            Parameters
                  type [string]
                  username [string] The username for the credential.
                  password [string] The password for the credential.
                  name [string, optional] The name identifying the credential.
                  description [string, optional] A long description of the credential.
                  remote_host_id [integer, optional] The ID of the remote host associated with the cre-
                       dential.
                  state [string, optional] The U.S. state for the credential. Only for VAN credentials.
                  system_credential [boolean, optional]
            Returns
                  id [integer] The ID of the credential.
                  name [string] The name identifying the credential
                  type [string] The credential's type.
                  username [string] The username for the credential.
                  description [string] A long description of the credential.
                  owner [string] The name of the user who this credential belongs to.
                  remote_host_id [integer] The ID of the remote host associated with this credential.
                  remote_host_name [string] The name of the remote host associated with this creden-
                       tial.
                  state [string] The U.S. state for the credential. Only for VAN credentials.
                  created_at [string/time] The creation time for this credential.
                  updated_at [string/time] The last modification time for this credential.
post_authenticate(url, remote_host_type, username, password)
      Authenticate against a remote host
            Parameters
                  url [string] The URL to your host.
```

- name: string

```
remote_host_type [string] The type of remote host. One of: RemoteHost-
Types::Bitbucket, RemoteHostTypes::Ftp, RemoteHostTypes::Github, Remote-
HostTypes::GoogleDoc, RemoteHostTypes::JDBC, RemoteHostTypes::Postgres,
RemoteHostTypes::Redshift, RemoteHostTypes::Salesforce, and RemoteHost-
Types::Van
```

username [string] The username for the credential.

password [string] The password for the credential.

## Returns

id [integer] The ID of the credential.

**name** [string] The name identifying the credential

**type** [string] The credential's type.

**username** [string] The username for the credential.

description [string] A long description of the credential.

**owner** [string] The name of the user who this credential belongs to.

**remote\_host\_id** [integer] The ID of the remote host associated with this credential.

**remote\_host\_name** [string] The name of the remote host associated with this credential.

**state** [string] The U.S. state for the credential. Only for VAN credentials.

created\_at [string/time] The creation time for this credential.

updated\_at [string/time] The last modification time for this credential.

# post\_temporary (id, \*, duration='DEFAULT')

Generate a temporary credential for accessing S3

#### **Parameters**

id [integer] The ID of the credential.

**duration** [integer, optional] The number of seconds the temporary credential should be valid. Defaults to 15 minutes. Must not be less than 15 minutes or greater than 36 hours.

## Returns

access\_key [string] The identifier of the credential.

**secret\_access\_key** [string] The secret part of the credential.

**session token** [string] The session token identifier.

put (id, type, username, password, \*, name='DEFAULT', description='DEFAULT', remote\_host\_id='DEFAULT', state='DEFAULT', system\_credential='DEFAULT')
Update an existing credential

# **Parameters**

id [integer] The ID of the credential.

type [string]

**username** [string] The username for the credential.

password [string] The password for the credential.

**name** [string, optional] The name identifying the credential.

```
description [string, optional] A long description of the credential.
                  remote_host_id [integer, optional] The ID of the remote host associated with the cre-
                        dential.
                  state [string, optional] The U.S. state for the credential. Only for VAN credentials.
                  system credential [boolean, optional]
            Returns
                  id [integer] The ID of the credential.
                  name [string] The name identifying the credential
                  type [string] The credential's type.
                  username [string] The username for the credential.
                  description [string] A long description of the credential.
                  owner [string] The name of the user who this credential belongs to.
                  remote host id [integer] The ID of the remote host associated with this credential.
                  remote host name [string] The name of the remote host associated with this creden-
                        tial.
                  state [string] The U.S. state for the credential. Only for VAN credentials.
                  created at [string/time] The creation time for this credential.
                  updated_at [string/time] The last modification time for this credential.
put_shares_groups(id, group_ids, permission_level, *, share_email_body='DEFAULT',
      send_shared_email='DEFAULT')
Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                          • users [list::]
                                 - id: integer
                                 - name: string
                          • groups [list::]
                                 - id: integer
                                 - name: string
                  writers [dict::]
                          • users [list::]
                                 - id: integer
```

```
- name: string
                          • groups [list::]
                                - id: integer
                                - name: string
                  owners [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer
                                - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                       and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.
                                                                     share_email_body='DEFAULT',
put_shares_users (id,
                              user_ids, permission_level,
                        send shared email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer
                                - name : string
                  writers [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer
```

```
- name: string
                        owners [dict::]
                               • users [list::]
                                      - id: integer
                                      - name: string
                                • groups [list::]
                                      - id: integer
                                      - name: string
                        total_user_shares [integer] For owners, the number of total users shared. For writers
                             and readers, the number of visible users shared.
                        total_group_shares [integer] For owners, the number of total groups shared. For writ-
                             ers and readers, the number of visible groups shared.
class Databases (session_kwargs, return_type='civis')
      delete_whitelist_ips (id, whitelisted_ip_id)
            Remove a whitelisted IP address
                  Parameters
                        id [integer] The ID of the database this rule is applied to.
                        whitelisted ip id [integer] The ID of this whitelisted IP address.
                  Returns
                        None Response code 204: success
            Show database information
                  Parameters
                        id [integer] The ID for the database.
                  Returns
                        id [integer] The ID for the database.
                        name [string] The name of the database.
                        adapter [string] The type of the database.
      get_whitelist_ips (id, whitelisted_ip_id)
            View details about a whitelisted IP
                  Parameters
                        id [integer] The ID of the database this rule is applied to.
```

**Databases** 

**Methods** 

get (id)

6.5. API Client 95

whitelisted\_ip\_id [integer] The ID of this whitelisted IP address.

## Returns

id [integer] The ID of this whitelisted IP address.

remote\_host\_id [integer] The ID of the database this rule is applied to.

security\_group\_id [string] The ID of the security group this rule is applied to.

**subnet mask** [string] The subnet mask that is allowed by this rule.

authorized by [string] The user who authorized this rule.

is\_active [boolean] True if the rule is applied, false if it has been revoked.

created\_at [string/time] The time this rule was created.

updated\_at [string/time] The time this rule was last updated.

#### list()

List databases

## Returns

id [integer] The ID for the database.

**name** [string] The name of the database.

adapter [string] The type of the database.

## list schemas(id)

List schemas in this database

#### **Parameters**

id [integer] The ID of the database.

## **Returns**

**schema** [string] The name of a schema.

# list\_whitelist\_ips (id)

List whitelisted IPs for the specified database

## **Parameters**

id [integer] The ID for the database.

# Returns

id [integer] The ID of this whitelisted IP address.

**remote\_host\_id** [integer] The ID of the database this rule is applied to.

**security\_group\_id** [string] The ID of the security group this rule is applied to.

**subnet mask** [string] The subnet mask that is allowed by this rule.

created\_at [string/time] The time this rule was created.

updated\_at [string/time] The time this rule was last updated.

# post\_whitelist\_ips (id, subnet\_mask)

Whitelist an IP address

# **Parameters**

id [integer] The ID of the database this rule is applied to.

subnet\_mask [string] The subnet mask that is allowed by this rule.

## Returns

**id** [integer] The ID of this whitelisted IP address.

```
remote_host_id [integer] The ID of the database this rule is applied to.
                       security_group_id [string] The ID of the security group this rule is applied to.
                       subnet_mask [string] The subnet mask that is allowed by this rule.
                       authorized_by [string] The user who authorized this rule.
                       is active [boolean] True if the rule is applied, false if it has been revoked.
                       created_at [string/time] The time this rule was created.
                       updated_at [string/time] The time this rule was last updated.
class Endpoints (session_kwargs, return_type='civis')
           List API endpoints
                 Returns
                       None Response code 200: success
class Enhancements (session_kwargs, return_type='civis')
     delete_cass_ncoa_projects (id, project_id)
           Remove a JobTypes::CassNcoa from a project
                 Parameters
                       id [integer] The ID of the resource.
                       project_id [integer] The ID of the project.
                 Returns
                       None Response code 204: success
     delete_cass_ncoa_runs (id, run_id)
           Cancel a run
                 Parameters
                       id [integer] The ID of the cass_ncoa.
                       run_id [integer] The ID of the run.
```

**Endpoints** 

Methods

list()

**Enhancements** 

**Methods** 

**Returns** 

```
None Response code 202: success
delete_cass_ncoa_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group_id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete_cass_ncoa_shares_users (id, user_id)
     Revoke the permissions a user has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 user_id [integer] The ID of the user.
           Returns
                 None Response code 204: success
delete_civis_data_match_projects (id, project_id)
     Remove a container docker from a project
           Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
           Returns
                 None Response code 204: success
delete_civis_data_match_runs (id, run_id)
     Cancel a run
           Parameters
                 id [integer] The ID of the civis_data_match.
                 run_id [integer] The ID of the run.
           Returns
                 None Response code 202: success
delete civis data match shares groups (id, group id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group_id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete_civis_data_match_shares_users (id, user_id)
     Revoke the permissions a user has on this object
           Parameters
```

id [integer] The ID of the resource that is shared.

```
None Response code 204: success
delete_data_unification_projects (id, project_id)
     Remove a container docker from a project
           Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
           Returns
                 None Response code 204: success
delete_data_unification_runs (id, run_id)
     Cancel a run
           Parameters
                 id [integer] The ID of the data unification.
                 run id [integer] The ID of the run.
           Returns
                 None Response code 202: success
delete_data_unification_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group_id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete_data_unification_shares_users (id, user_id)
     Revoke the permissions a user has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 user_id [integer] The ID of the user.
           Returns
                 None Response code 204: success
delete_geocode_projects (id, project_id)
     Remove a JobTypes::Geocode from a project
           Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
           Returns
                 None Response code 204: success
delete_geocode_runs (id, run_id)
     Cancel a run
```

user\_id [integer] The ID of the user.

Returns

## **Parameters**

**id** [integer] The ID of the geocode.

run\_id [integer] The ID of the run.

## Returns

None Response code 202: success

# delete\_geocode\_shares\_groups (id, group\_id)

Revoke the permissions a group has on this object

## **Parameters**

id [integer] The ID of the resource that is shared.

group\_id [integer] The ID of the group.

## **Returns**

None Response code 204: success

# delete\_geocode\_shares\_users (id, user\_id)

Revoke the permissions a user has on this object

#### **Parameters**

id [integer] The ID of the resource that is shared.

user\_id [integer] The ID of the user.

## Returns

None Response code 204: success

# delete\_person\_matching\_projects (id, project\_id)

Remove a container docker from a project

## **Parameters**

id [integer] The ID of the resource.

project\_id [integer] The ID of the project.

# Returns

None Response code 204: success

# delete\_person\_matching\_runs(id, run\_id)

Cancel a run

## **Parameters**

id [integer] The ID of the person matching.

run\_id [integer] The ID of the run.

# Returns

None Response code 202: success

# ${\tt delete\_person\_matching\_shares\_groups}\ (id, group\_id)$

Revoke the permissions a group has on this object

### **Parameters**

id [integer] The ID of the resource that is shared.

group\_id [integer] The ID of the group.

## Returns

```
None Response code 204: success
delete_person_matching_shares_users(id, user_id)
     Revoke the permissions a user has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 user_id [integer] The ID of the user.
           Returns
                 None Response code 204: success
delete_table_deduplication_projects (id, project_id)
     Remove a container docker from a project
           Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
           Returns
                 None Response code 204: success
delete_table_deduplication_runs (id, run_id)
     Cancel a run
           Parameters
                 id [integer] The ID of the table_deduplication.
                 run_id [integer] The ID of the run.
           Returns
                 None Response code 202: success
delete_table_deduplication_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group_id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete table deduplication shares users (id, user id)
     Revoke the permissions a user has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 user_id [integer] The ID of the user.
           Returns
                 None Response code 204: success
get_cass_ncoa(id)
     Get a CASS/NCOA Enhancement
           Parameters
                 id [integer]
```

## Returns

**id** [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

**updated** at [string/time] The time the enhancement was last updated.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

## schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

# source [dict::]

- database\_table [dict::]
  - schema [string] The schema name of the source table.
  - table [string] The name of the source table.
  - remote\_host\_id [integer] The ID of the database host for the table.
  - credential\_id [integer] The id of the credentials to be used when performing the enhancement.
  - multipart\_key [list] The source table primary key.

## destination [dict::]

- database\_table [dict::]
  - schema [string] The schema name for the output data.
  - table [string] The table name for the output data.

# column\_mapping [dict::]

- address1 [string] The first address line.
- address2 [string] The second address line.
- city [string] The city of an address.
- state [string] The state of an address.
- **zip** [string] The zip code of an address.
- **name** [string] The full name of the resident at this address. If needed, separate multiple columns with +, e.g. *first\_name+last\_name*
- company [string] The name of the company located at this address.
- **use\_default\_column\_mapping** [boolean] Defaults to true, where the existing column mapping on the input table will be used. If false, a custom column mapping must be provided.
- **perform\_ncoa** [boolean] Whether to update addresses for records matching the National Change of Address (NCOA) database.
- **ncoa\_credential\_id** [integer] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.
- output\_level [string] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.
- **limiting\_sql** [string] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

```
archived [string] The archival status of the requested item(s).
get_cass_ncoa_runs (id, run_id)
      Check status of a run
            Parameters
                  id [integer] The ID of the cass ncoa.
                  run_id [integer] The ID of the run.
            Returns
                  id [integer] The ID of the run.
                  cass_ncoa_id [integer] The ID of the cass_ncoa.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                       'cancelled'.
                  is_cancel_requested [boolean] True if run cancel requested, else false.
                  started_at [string/time] The time the last run started at.
                  finished_at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
get civis data match(id)
      Get a Civis Data Match Enhancement
            Parameters
                  id [integer]
            Returns
                  id [integer] The ID for the enhancement.
                  name [string] The name of the enhancement job.
                  type [string] The type of the enhancement (e.g CASS-NCOA)
                  created_at [string/time] The time this enhancement was created.
                  updated_at [string/time] The time the enhancement was last updated.
                  author [dict::]
                          • id [integer] The ID of this user.
                          • name [string] This user's name.
                          • username [string] This user's username.
                          • initials [string] This user's initials.
                          • online [boolean] Whether this user is online.
                  state [string] The status of the enhancement's last run
                  schedule [dict::]
                          • scheduled [boolean] If the item is scheduled.
                          • scheduled_days [list] Day based on numeric value starting at 0 for Sunday.
                          • scheduled_hours [list] Hours of the day it is scheduled on.
                          • scheduled minutes [list] Minutes of the day it is scheduled on.
```

• **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.
- **input\_field\_mapping** [dict] The column mapping for the input table/file. See /enhancements/field\_mapping for list of valid fields.

## input\_table [dict::]

- database name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.
- match\_target\_id [integer] The ID of the Civis Data match target. See /match\_targets for IDs.

## output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.

• table [string] The table name.

**output\_filename** [string] The name of the output file. This should be set if and only if inputFileId is set.

**max\_matches** [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

## get\_civis\_data\_match\_runs(id, run\_id)

Check status of a run

### **Parameters**

id [integer] The ID of the civis\_data\_match.

run\_id [integer] The ID of the run.

### **Returns**

id [integer] The ID of the run.

civis\_data\_match\_id [integer] The ID of the civis\_data\_match.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

finished\_at [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

## get\_data\_unification(id)

Get a Data Unification Enhancement

#### **Parameters**

id [integer]

# Returns

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

**created at** [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

schedule [dict::]

- **scheduled** [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**field\_mapping1** [dict] The column mapping for Table/File 1. See /enhance-ments/field\_mapping for list of valid fields.

## table1 [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**file1\_id** [integer] The ID for File 1. This should be set if and only if table1, table2, and outputTable are not set.

**field\_mapping2** [dict] The column mapping for Table/File 2. See /enhance-ments/field\_mapping for list of valid fields.

## table2 [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**file2\_id** [integer] The ID for File 2. This should be set if and only if table1, table2, and outputTable is not set.

## output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

output\_filename [string] The name of the output file. This should be set if and only if file1Id and file2Id are set.

**max\_matches** [integer] The maximum number of matches per record in Table/File 1 to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

### get data unification runs (id, run id)

Check status of a run

### **Parameters**

**id** [integer] The ID of the data\_unification.

run\_id [integer] The ID of the run.

#### Returns

id [integer] The ID of the run.

data\_unification\_id [integer] The ID of the data\_unification.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

# $get\_geocode(id)$

Get a Geocode Enhancement

### **Parameters**

id [integer]

## Returns

**id** [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.

Returns

Returns

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

```
• username [string] This user's username.
                         • initials [string] This user's initials.
                         • online [boolean] Whether this user is online.
                  remote_host_id [integer] The ID of the remote host.
                  credential id [integer] The ID of the remote host credential.
                  source schema and table [string] The source database schema and table.
                  multipart_key [list] The source table primary key.
                  limiting_sql [string] The limiting SQL for the source table. "WHERE" should be
                       omitted (e.g. state='IL').
                  target_schema [string] The output table schema.
                  target_table [string] The output table name.
                  country [string] The country of the addresses to be geocoded; either 'us' or 'ca'.
                  provider [string] The geocoding provider; one of postgis, nominatim, and
                       geocoder_ca.
                  output_address [boolean] Whether to output the parsed address. Only guaranteed for
                       the 'postgis' provider.
                  archived [string] The archival status of the requested item(s).
get_geocode_runs (id, run_id)
      Check status of a run
            Parameters
                  id [integer] The ID of the geocode.
                  run_id [integer] The ID of the run.
                  id [integer] The ID of the run.
                  geocode_id [integer] The ID of the geocode.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                       'cancelled'.
                  is_cancel_requested [boolean] True if run cancel requested, else false.
                  started_at [string/time] The time the last run started at.
                  finished_at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
get_person_matching(id)
      Get a Person Matching Enhancement
            Parameters
                  id [integer]
                  id [integer] The ID for the enhancement.
```

**created\_at** [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

## schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.

- initials [string] This user's initials.
- online [boolean] Whether this user is online.

## configuration [dict::]

- task [string] The type of person matching task. Options are: "table\_to\_table", "dedupe\_table", or "table\_to\_civis\_data".
- source [string] The input source of your data. Options are: "redshift" or "s3".
- input\_database\_name [string] The Redshift database name for input data.
- input\_schema [string] The schema name for the input data.
- input\_table [string] The table name for the input data.
- input\_file\_id [string] The ID of the input S3 file.
- **input\_field\_mapping** [string] The column mapping for the input in JSON or YAML.
- **input\_file\_headers** [string] Provide your headers in a list if the first row of your input does not have the headers, and make them JSON-decodable. For example: ["col1","col2","col3"].
- target\_database\_name [string] The Redshift database for target data.
- target\_schema [string] The schema for target data.
- target table [string] The table for target data.
- target\_field\_mapping [string] The column mapping for the target in JSON or YAML.
- target\_file\_id [string] The ID of the target S3 file.
- match\_target\_id [integer] The ID of the match target.
- match\_database\_name [string] The Redshift database for the match output table.
- match\_schema [string] The schema for the match output table.
- match\_table [string] The name of the match output table.
- match\_csv\_filename [string] The name of the match output file.
- match\_source\_id\_col [string] The name of the column in the output table that will hold the id from the source for each match.
- match\_target\_id\_col [string] The name the column in the output table that will hold the id from the target for each match.
- max\_matches [integer] The maximum number of matches to return.
- **threshold** [number/float] The score threshold (between 0 and 1).

# ${\tt get\_person\_matching\_runs}\ (id, run\_id)$

Check status of a run

## **Parameters**

**id** [integer] The ID of the person\_matching.

run id [integer] The ID of the run.

#### Returns

```
id [integer] The ID of the run.
```

person\_matching\_id [integer] The ID of the person\_matching.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

started\_at [string/time] The time the last run started at.

finished\_at [string/time] The time the last run completed.

error [string] The error, if any, returned by the run.

## get\_table\_deduplication (id)

Get a Table Deduplication Enhancement

#### **Parameters**

id [integer]

### Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

type [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

## author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

## schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**input\_field\_mapping** [dict] The column mapping for the input table. See /enhance-ments/field\_mapping for list of valid fields.

# input\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.

## output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **output\_filename** [string] The name of the output file. This should be set if and only if inputFileId is set.
- **max\_matches** [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.
- **threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

## get\_table\_deduplication\_runs(id, run\_id)

Check status of a run

## **Parameters**

id [integer] The ID of the table deduplication.

run\_id [integer] The ID of the run.

#### Returns

id [integer] The ID of the run.

**table\_deduplication\_id** [integer] The ID of the table\_deduplication.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

started\_at [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

list (\*, type='DEFAULT', author='DEFAULT', status='DEFAULT', archived='DEFAULT',
 limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT',
 iterator='DEFAULT')
List Enhancements

#### **Parameters**

**type** [string, optional] If specified, return items of these types.

author [string, optional] If specified, return items from this author. Must use user IDs. A comma separated list of IDs is also accepted to return items from multiple authors.

**status** [string, optional] If specified, returns items with one of these statuses. It accepts a comma-separated list, possible values are 'running', 'failed', 'succeeded', 'idle', 'scheduled'.

archived [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

order [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at, last\_run.updated\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

# Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

**created\_at** [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

**archived** [string] The archival status of the requested item(s).

list\_cass\_ncoa\_projects(id, \*, hidden='DEFAULT')

List the projects a JobTypes::CassNcoa belongs to

#### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

#### Returns

id [integer] The ID for this project.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of this project.

description [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

```
auto_share [boolean]
```

created\_at [string/time]

updated\_at [string/time]

**archived** [string] The archival status of the requested item(s).

list\_cass\_ncoa\_runs (id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')

List runs for the given cass\_ncoa

## **Parameters**

id [integer] The ID of the cass\_ncoa.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The ID of the run.

cass\_ncoa\_id [integer] The ID of the cass\_ncoa.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

finished at [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

list\_cass\_ncoa\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')

Get the logs for a run

## **Parameters**

id [integer] The ID of the cass\_ncoa.

run\_id [integer] The ID of the run.

last\_id [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

## Returns

id [integer] The ID of the log.

created\_at [string/date-time] The time the log was created.

message [string] The log message.

**level** [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

list\_cass\_ncoa\_runs\_outputs (id, run\_id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')

List the outputs for a run

# **Parameters**

id [integer] The ID of the job.

run\_id [integer] The ID of the run.

```
limit [integer, optional] Number of results to return. Defaults to its maximum of 50.
```

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to created at. Must be one of: created at, id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

### **Returns**

```
object_type [string] The type of the output. Valid values are File, Table, Report, Project, Credential, or JSONValue
```

object\_id [integer] The ID of the output.

**name** [string] The name of the output.

**link** [string] The hypermedia link to the output.

value [string]

## list\_cass\_ncoa\_shares (id)

List users and groups permissioned on this object

#### **Parameters**

id [integer] The ID of the resource that is shared.

# Returns

```
readers [dict::]
```

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id: integer
  - name : string

### writers [dict::]

- users [list::]
  - id: integer
  - name : string
- groups [list::]
  - id: integer
  - name: string

# owners [dict::]

- users [list::]
  - id : integer

```
- name: string
                         • groups [list::]
                                - id: integer
                                - name: string
                  total user shares [integer] For owners, the number of total users shared. For writers
                       and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.
list_civis_data_match_projects(id, *, hidden='DEFAULT')
      List the projects a container docker belongs to
            Parameters
                  id [integer] The ID of the resource.
                  hidden [boolean, optional] If specified to be true, returns hidden items. Defaults to
                       false, returning non-hidden items.
            Returns
                  id [integer] The ID for this project.
                  author [dict::]
                         • id [integer] The ID of this user.
                         • name [string] This user's name.
                         • username [string] This user's username.
                         • initials [string] This user's initials.
                         • online [boolean] Whether this user is online.
                  name [string] The name of this project.
                  description [string] A description of the project.
                  users [list::] Users who can see the project. - id : integer
                            The ID of this user.
                         • name [string] This user's name.
                         • username [string] This user's username.
                         • initials [string] This user's initials.
                         • online [boolean] Whether this user is online.
                  auto_share [boolean]
                  created_at [string/time]
                  updated_at [string/time]
                  archived [string] The archival status of the requested item(s).
list_civis_data_match_runs(id,
                                                      limit='DEFAULT',
                                                                             page_num='DEFAULT',
                                                                 order_dir='DEFAULT',
                                       order='DEFAULT',
                                                                                                itera-
```

6.5. API Client 119

tor = 'DEFAULT')

List runs for the given civis\_data\_match

**Parameters** 

id [integer] The ID of the civis\_data\_match.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

### **Returns**

id [integer] The ID of the run.

civis\_data\_match\_id [integer] The ID of the civis\_data\_match.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

started\_at [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

list\_civis\_data\_match\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')
Get the logs for a run

## **Parameters**

id [integer] The ID of the civis\_data\_match.

run\_id [integer] The ID of the run.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

## Returns

id [integer] The ID of the log.

created\_at [string/date-time] The time the log was created.

message [string] The log message.

**level** [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

List the outputs for a run

#### **Parameters**

id [integer] The ID of the job.

```
run_id [integer] The ID of the run.
                  limit [integer, optional] Number of results to return. Defaults to its maximum of 50.
                  page_num [integer, optional] Page number of the results to return. Defaults to the first
                       page, 1.
                  order [string, optional] The field on which to order the result set. Defaults to cre-
                        ated at. Must be one of: created at, id.
                  order_dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                       (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                       limit and page_num are ignored. Defaults to False.
            Returns
                  object_type [string] The type of the output. Valid values are File, Table, Report,
                       Project, Credential, or JSONValue
                  object_id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
list_civis_data_match_shares(id)
      List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

## list\_data\_unification\_projects(id, \*, hidden='DEFAULT')

List the projects a container docker belongs to

### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

#### Returns

id [integer] The ID for this project.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

name [string] The name of this project.

**description** [string] A description of the project.

users [list::] Users who can see the project. - id : integer

The ID of this user.

- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

```
auto_share [boolean]
created_at [string/time]

```

**archived** [string] The archival status of the requested item(s).

```
list_data_unification_runs (id, *, limit='DEFAULT', page_num='DEFAULT', order='DEFAULT', order_dir='DEFAULT', iterator='DEFAULT')
```

List runs for the given data\_unification

#### **Parameters**

id [integer] The ID of the data\_unification.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The ID of the run.

data\_unification\_id [integer] The ID of the data\_unification.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

started\_at [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

list\_data\_unification\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')

Get the logs for a run

## **Parameters**

id [integer] The ID of the data unification.

run id [integer] The ID of the run.

last\_id [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

### Returns

id [integer] The ID of the log.

**created\_at** [string/date-time] The time the log was created.

message [string] The log message.

**level** [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

```
list data unification runs outputs (id.
                                                            run id,
                                                                                  limit='DEFAULT',
                                                  page_num='DEFAULT'.
                                                                                  order='DEFAULT'.
                                                  order dir='DEFAULT', iterator='DEFAULT')
     List the outputs for a run
            Parameters
                  id [integer] The ID of the job.
                  run_id [integer] The ID of the run.
                  limit [integer, optional] Number of results to return. Defaults to its maximum of 50.
                  page num [integer, optional] Page number of the results to return. Defaults to the first
                       page, 1.
                  order [string, optional] The field on which to order the result set. Defaults to cre-
                       ated at. Must be one of: created at, id.
                  order_dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                       (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                       when more results than the maximum allowed by limit are needed. When True,
                       limit and page_num are ignored. Defaults to False.
            Returns
                  object_type [string] The type of the output. Valid values are File, Table, Report,
                       Project, Credential, or JSONValue
                  object_id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
list_data_unification_shares (id)
      List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                         • users [list::]

```

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

# list\_field\_mapping()

List the fields in a field mapping for Civis Data Match, Data Unification, and Table Deduplication jobs **Returns** 

field [string] The name of the field.

**description** [string] The description of the field.

## list\_geocode\_projects (id, \*, hidden='DEFAULT')

List the projects a JobTypes::Geocode belongs to

## **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

# Returns

```
id [integer] The ID for this project.
```

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of this project.

**description** [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

• name [string] This user's name.

- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto share [boolean]

created\_at [string/time]

updated at [string/time]

**archived** [string] The archival status of the requested item(s).

list\_geocode\_runs (id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order='DEFAULT', iterator='DEFAULT')

List runs for the given geocode

#### **Parameters**

id [integer] The ID of the geocode.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The ID of the run.

**geocode\_id** [integer] The ID of the geocode.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

finished\_at [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

list\_geocode\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')

Get the logs for a run

#### **Parameters**

id [integer] The ID of the geocode.

run\_id [integer] The ID of the run.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

## Returns

id [integer] The ID of the log.

**created at** [string/date-time] The time the log was created.

message [string] The log message.

level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

List the outputs for a run

## **Parameters**

id [integer] The ID of the job.

run\_id [integer] The ID of the run.

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to created\_at. Must be one of: created\_at, id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

**object\_type** [string] The type of the output. Valid values are File, Table, Report, Project, Credential, or JSONValue

**object\_id** [integer] The ID of the output.

name [string] The name of the output.

link [string] The hypermedia link to the output.

value [string]

### list geocode shares (id)

List users and groups permissioned on this object

# **Parameters**

id [integer] The ID of the resource that is shared.

#### Returns

```
readers [dict::]
```

- users [list::]
  - id: integer
  - name: string
- groups [list::]

```
- id: integer
```

- name: string

# writers [dict::]

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id: integer
  - name: string

### owners [dict::]

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id: integer
  - name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

# list\_person\_matching\_projects (id, \*, hidden='DEFAULT')

List the projects a container docker belongs to

#### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

#### Returns

id [integer] The ID for this project.

### author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

name [string] The name of this project.

description [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto\_share [boolean]

created at [string/time]

updated\_at [string/time]

**archived** [string] The archival status of the requested item(s).

list\_person\_matching\_runs (id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')
List runs for the given person\_matching

#### **Parameters**

id [integer] The ID of the person\_matching.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

### Returns

id [integer] The ID of the run.

person\_matching\_id [integer] The ID of the person\_matching.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

started\_at [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

list\_person\_matching\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')
Get the logs for a run

## **Parameters**

id [integer] The ID of the person\_matching.

run\_id [integer] The ID of the run.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

#### **Returns**

```
id [integer] The ID of the log.
```

**created at** [string/date-time] The time the log was created.

message [string] The log message.

level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

```
\begin{tabular}{ll} \textbf{list\_person\_matching\_runs\_outputs} (id, & run\_id, & *, & limit='DEFAULT', \\ & page\_num='DEFAULT', & order='DEFAULT', & order\_dir='DEFAULT', & iterator='DEFAULT') \end{tabular}
```

List the outputs for a run

## **Parameters**

id [integer] The ID of the job.

run\_id [integer] The ID of the run.

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to created\_at. Must be one of: created\_at, id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

### **Returns**

```
object_type [string] The type of the output. Valid values are File, Table, Report, Project, Credential, or JSONValue
```

object\_id [integer] The ID of the output.

name [string] The name of the output.

link [string] The hypermedia link to the output.

value [string]

## list\_person\_matching\_shares (id)

List users and groups permissioned on this object

## **Parameters**

id [integer] The ID of the resource that is shared.

### Returns

```
readers [dict::]
```

- users [list::]
  - id : integer
  - name: string
- groups [list::]

```
id: integer
name: string
writers [dict::]
users [list::]
id: integer
name: string
groups [list::]
id: integer
```

# owners [dict::]

- users [list::]
  - id: integer
  - name: string

- name: string

- groups [list::]
  - id: integer
  - name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

# list\_table\_deduplication\_projects(id, \*, hidden='DEFAULT')

List the projects a container docker belongs to

#### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

#### Returns

```
id [integer] The ID for this project.
```

### author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

name [string] The name of this project.

description [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto\_share [boolean]

created\_at [string/time]

updated\_at [string/time]

**archived** [string] The archival status of the requested item(s).

List runs for the given table\_deduplication

#### **Parameters**

id [integer] The ID of the table\_deduplication.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

id [integer] The ID of the run.

**table\_deduplication\_id** [integer] The ID of the table\_deduplication.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

finished\_at [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

Get the logs for a run

## **Parameters**

id [integer] The ID of the table\_deduplication.

run id [integer] The ID of the run.

last\_id [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

#### Returns

```
id [integer] The ID of the log.
```

created\_at [string/date-time] The time the log was created.

message [string] The log message.

level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

```
\begin{table} {\bf list\_table\_deduplication\_runs\_outputs} (id, run\_id, *, limit='DEFAULT', \\ page\_num='DEFAULT', order='DEFAULT', \\ order\_dir='DEFAULT', iterator='DEFAULT') \end{table}
```

List the outputs for a run

### **Parameters**

id [integer] The ID of the job.

run\_id [integer] The ID of the run.

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to created\_at. Must be one of: created\_at, id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

```
object_type [string] The type of the output. Valid values are File, Table, Report, Project, Credential, or JSONValue
```

object\_id [integer] The ID of the output.

**name** [string] The name of the output.

**link** [string] The hypermedia link to the output.

value [string]

# list\_table\_deduplication\_shares (id)

List users and groups permissioned on this object

### **Parameters**

id [integer] The ID of the resource that is shared.

## Returns

```
readers [dict::]
```

• users [list::]

```
- id: integer
                              - name: string
                        • groups [list::]
                              - id: integer
                              - name: string
                 writers [dict::]
                        • users [list::]
                              - id: integer
                              - name: string
                        • groups [list::]
                              - id: integer
                              - name: string
                 owners [dict::]
                        • users [list::]
                              - id: integer
                              - name: string
                        • groups [list::]
                              - id: integer
                              - name: string
                 total user shares [integer] For owners, the number of total users shared. For writers
                      and readers, the number of visible users shared.
                 total_group_shares [integer] For owners, the number of total groups shared. For writ-
                      ers and readers, the number of visible groups shared.
list_types()
     List available enhancement types
           Returns
                 name [string] The name of the type.
patch_cass_ncoa(id, *, name='DEFAULT', schedule='DEFAULT', parent_id='DEFAULT',
                      notifications='DEFAULT', source='DEFAULT', destination='DEFAULT', col-
                      umn_mapping='DEFAULT',
                                                       use_default_column_mapping='DEFAULT',
                      perform ncoa='DEFAULT',
                                                      ncoa credential id='DEFAULT',
                      put_level='DEFAULT', limiting_sql='DEFAULT')
     Update some attributes of this CASS/NCOA Enhancement
```

## **Parameters**

id [integer] The ID for the enhancement.

**name** [string, optional] The name of the enhancement job.

**schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.

- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

## notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# source [dict, optional::]

- database\_table [dict::]
  - schema [string] The schema name of the source table.
  - table [string] The name of the source table.
  - remote\_host\_id [integer] The ID of the database host for the table.
  - credential\_id [integer] The id of the credentials to be used when performing the enhancement.
  - multipart\_key [list] The source table primary key.

### destination [dict, optional::]

- database\_table [dict::]
  - schema [string] The schema name for the output data.
  - table [string] The table name for the output data.

## column\_mapping [dict, optional::]

- address1 [string] The first address line.
- address2 [string] The second address line.
- city [string] The city of an address.
- state [string] The state of an address.
- zip [string] The zip code of an address.

- **name** [string] The full name of the resident at this address. If needed, separate multiple columns with +, e.g. *first\_name+last\_name*
- **company** [string] The name of the company located at this address.
- **use\_default\_column\_mapping** [boolean, optional] Defaults to true, where the existing column mapping on the input table will be used. If false, a custom column mapping must be provided.
- **perform\_ncoa** [boolean, optional] Whether to update addresses for records matching the National Change of Address (NCOA) database.
- **ncoa\_credential\_id** [integer, optional] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.
- output\_level [string, optional] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.
- **limiting\_sql** [string, optional] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

#### Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

type [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

notifications [dict::]

• urls [list] URLs to receive a POST request at job completion

- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

## source [dict::]

- database\_table [dict::]
  - schema [string] The schema name of the source table.
  - table [string] The name of the source table.
  - remote\_host\_id [integer] The ID of the database host for the table.
  - credential\_id [integer] The id of the credentials to be used when performing the enhancement.
  - multipart\_key [list] The source table primary key.

### destination [dict::]

- database\_table [dict::]
  - schema [string] The schema name for the output data.
  - table [string] The table name for the output data.

## column\_mapping [dict::]

- address1 [string] The first address line.
- address2 [string] The second address line.
- city [string] The city of an address.
- state [string] The state of an address.

- **zip** [string] The zip code of an address.
- **name** [string] The full name of the resident at this address. If needed, separate multiple columns with +, e.g. *first\_name+last\_name*
- **company** [string] The name of the company located at this address.
- **use\_default\_column\_mapping** [boolean] Defaults to true, where the existing column mapping on the input table will be used. If false, a custom column mapping must be provided.
- **perform\_ncoa** [boolean] Whether to update addresses for records matching the National Change of Address (NCOA) database.
- **ncoa\_credential\_id** [integer] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.
- output\_level [string] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.
- **limiting\_sql** [string] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

**archived** [string] The archival status of the requested item(s).

Update some attributes of this Civis Data Match Enhancement

## **Parameters**

id [integer] The ID for the enhancement.

**name** [string, optional] The name of the enhancement job.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.

- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**input\_field\_mapping** [dict, optional] The column mapping for the input table/file. See /enhancements/field\_mapping for list of valid fields.

input\_table [dict, optional::]

- database name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **input\_file\_id** [integer, optional] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.
- match\_target\_id [integer, optional] The ID of the Civis Data match target. See /match targets for IDs.

output\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **output\_filename** [string, optional] The name of the output file. This should be set if and only if inputFileId is set.
- **max\_matches** [integer, optional] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.
- **threshold** [number/float, optional] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

### Returns

**id** [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

type [string] The type of the enhancement (e.g CASS-NCOA)

**created\_at** [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.

- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

### schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### running as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**input\_field\_mapping** [dict] The column mapping for the input table/file. See /enhancements/field\_mapping for list of valid fields.

## input table [dict::]

• database name [string] The Redshift database name for the table.

- schema [string] The schema name for the table.
- table [string] The table name.
- input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.
- match\_target\_id [integer] The ID of the Civis Data match target. See /match\_targets for IDs.

output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- **table** [string] The table name.
- **output\_filename** [string] The name of the output file. This should be set if and only if inputFileId is set.
- max\_matches [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.
- **threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

```

```

Update some attributes of this Data Unification Enhancement

#### **Parameters**

id [integer] The ID for the enhancement.

**name** [string, optional] The name of the enhancement job.

**schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.

- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.
- **field\_mapping1** [dict, optional] The column mapping for Table/File 1. See /enhance-ments/field\_mapping for list of valid fields.

table1 [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file1\_id** [integer, optional] The ID for File 1. This should be set if and only if table1, table2, and outputTable are not set.
- **field\_mapping2** [dict, optional] The column mapping for Table/File 2. See /enhancements/field mapping for list of valid fields.

table2 [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file2\_id** [integer, optional] The ID for File 2. This should be set if and only if table1, table2, and outputTable is not set.

output\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- **table** [string] The table name.
- **output\_filename** [string, optional] The name of the output file. This should be set if and only if file1Id and file2Id are set.
- **max\_matches** [integer, optional] The maximum number of matches per record in Table/File 1 to return. Must be between 0 and 10. 0 returns all matches.
- **threshold** [number/float, optional] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

# Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

type [string] The type of the enhancement (e.g CASS-NCOA)

**created\_at** [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

#### schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

#### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.

- initials [string] This user's initials.
- online [boolean] Whether this user is online.
- **field\_mapping1** [dict] The column mapping for Table/File 1. See /enhance-ments/field\_mapping for list of valid fields.

#### table1 [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file1\_id** [integer] The ID for File 1. This should be set if and only if table1, table2, and outputTable are not set.
- **field\_mapping2** [dict] The column mapping for Table/File 2. See /enhance-ments/field\_mapping for list of valid fields.

## table2 [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file2\_id** [integer] The ID for File 2. This should be set if and only if table1, table2, and outputTable is not set.

#### output table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- output\_filename [string] The name of the output file. This should be set if and only if file1Id and file2Id are set.
- max\_matches [integer] The maximum number of matches per record in Table/File 1 to return. Must be between 0 and 10. 0 returns all matches.
- **threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

Update some attributes of this Geocode Enhancement

#### **Parameters**

id [integer] The ID for the enhancement.

**name** [string, optional] The name of the enhancement job.

#### **schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.

- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

**notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**remote\_host\_id** [integer, optional] The ID of the remote host.

**credential\_id** [integer, optional] The ID of the remote host credential.

**source\_schema\_and\_table** [string, optional] The source database schema and table.

multipart\_key [list, optional] The source table primary key.

**limiting\_sql** [string, optional] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

target\_schema [string, optional] The output table schema.

target\_table [string, optional] The output table name.

**country** [string, optional] The country of the addresses to be geocoded; either 'us' or 'ca'.

**provider** [string, optional] The geocoding provider; one of postgis, nominatim, and geocoder\_ca.

**output\_address** [boolean, optional] Whether to output the parsed address. Only guaranteed for the 'postgis' provider.

#### Returns

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

type [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

#### author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- **scheduled\_hours** [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

#### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.

• **online** [boolean] Whether this user is online.

**remote host id** [integer] The ID of the remote host.

credential\_id [integer] The ID of the remote host credential.

**source\_schema\_and\_table** [string] The source database schema and table.

multipart key [list] The source table primary key.

**limiting\_sql** [string] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

target\_schema [string] The output table schema.

target\_table [string] The output table name.

**country** [string] The country of the addresses to be geocoded; either 'us' or 'ca'.

provider [string] The geocoding provider; one of postgis, nominatim, and geocoder\_ca.

**output address** [boolean] Whether to output the parsed address. Only guaranteed for the 'postgis' provider.

**archived** [string] The archival status of the requested item(s).

patch person matching (id, name='DEFAULT', schedule='DEFAULT', parnotifications='DEFAULT'. ent\_id='DEFAULT', configuration='DEFAULT')
Update some attributes of this Person Matching Enhancement

#### **Parameters**

**id** [integer] The ID for the enhancement.

**name** [string, optional] The name of the enhancement job.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled days [list] Day based on numeric value starting at 0 for Sunday.
- **scheduled\_hours** [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- scheduled runs per hour [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."

- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# configuration [dict, optional::]

- task [string] The type of person matching task. Options are: "table\_to\_table", "dedupe\_table", or "table\_to\_civis\_data".
- **source** [string] The input source of your data. Options are: "redshift" or "s3".
- input\_database\_name [string] The Redshift database name for input data.
- input\_schema [string] The schema name for the input data.
- input\_table [string] The table name for the input data.
- input\_file\_id [string] The ID of the input S3 file.
- input\_field\_mapping [string] The column mapping for the input in JSON or YAML.
- **input\_file\_headers** [string] Provide your headers in a list if the first row of your input does not have the headers, and make them JSON-decodable. For example: ["col1","col2","col3"].
- target\_database\_name [string] The Redshift database for target data.
- target\_schema [string] The schema for target data.
- target\_table [string] The table for target data.
- target\_field\_mapping [string] The column mapping for the target in JSON or YAML.
- target\_file\_id [string] The ID of the target S3 file.
- match\_target\_id [integer] The ID of the match target.
- match\_database\_name [string] The Redshift database for the match output table.
- match\_schema [string] The schema for the match output table.
- match\_table [string] The name of the match output table.
- match\_csv\_filename [string] The name of the match output file.
- match\_source\_id\_col [string] The name of the column in the output table that will hold the id from the source for each match.
- match\_target\_id\_col [string] The name the column in the output table that will hold the id from the target for each match.
- max matches [integer] The maximum number of matches to return.
- **threshold** [number/float] The score threshold (between 0 and 1).

#### Returns

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

**created at** [string/time] The time this enhancement was created.

**updated** at [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

#### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

## configuration [dict::]

- task [string] The type of person matching task. Options are: "table\_to\_table", "dedupe\_table", or "table\_to\_civis\_data".
- source [string] The input source of your data. Options are: "redshift" or "s?"
- input\_database\_name [string] The Redshift database name for input data.
- input\_schema [string] The schema name for the input data.
- input\_table [string] The table name for the input data.
- input\_file\_id [string] The ID of the input S3 file.
- **input\_field\_mapping** [string] The column mapping for the input in JSON or YAML.
- **input\_file\_headers** [string] Provide your headers in a list if the first row of your input does not have the headers, and make them JSON-decodable. For example: ["col1","col2","col3"].
- target\_database\_name [string] The Redshift database for target data.
- target\_schema [string] The schema for target data.
- target\_table [string] The table for target data.
- target\_field\_mapping [string] The column mapping for the target in JSON or YAML.
- target\_file\_id [string] The ID of the target S3 file.
- match\_target\_id [integer] The ID of the match target.
- match\_database\_name [string] The Redshift database for the match output table.
- match schema [string] The schema for the match output table.
- match\_table [string] The name of the match output table.
- match\_csv\_filename [string] The name of the match output file.
- match\_source\_id\_col [string] The name of the column in the output table that will hold the id from the source for each match.
- match\_target\_id\_col [string] The name the column in the output table that will hold the id from the target for each match.
- max\_matches [integer] The maximum number of matches to return.
- threshold [number/float] The score threshold (between 0 and 1).

Update some attributes of this Table Deduplication Enhancement

#### **Parameters**

id [integer] The ID for the enhancement.

**name** [string, optional] The name of the enhancement job.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

**input\_field\_mapping** [dict, optional] The column mapping for the input table. See /enhancements/field\_mapping for list of valid fields.

input\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

input\_file\_id [integer, optional] The ID for the input file. This should be set if and
 only if inputTable and outputTable are not set.

output\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string, optional] The name of the output file. This should be set if and only if inputFileId is set.

**max\_matches** [integer, optional] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float, optional] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

#### Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

**updated** at [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**input\_field\_mapping** [dict] The column mapping for the input table. See /enhance-ments/field\_mapping for list of valid fields.

# input\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.

## output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **output\_filename** [string] The name of the output file. This should be set if and only if inputFileId is set.
- **max\_matches** [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.
- **threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

#### **Parameters**

**name** [string] The name of the enhancement job.

source [dict::]

- database\_table [dict::]
  - schema [string] The schema name of the source table.
  - table [string] The name of the source table.
  - **remote\_host\_id** [integer] The ID of the database host for the table.
  - credential\_id [integer] The id of the credentials to be used when performing the enhancement.
  - multipart\_key [list] The source table primary key.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

#### **destination** [dict, optional::]

- database table [dict::]
  - schema [string] The schema name for the output data.
  - table [string] The table name for the output data.

## column\_mapping [dict, optional::]

- address1 [string] The first address line.
- address2 [string] The second address line.
- city [string] The city of an address.
- state [string] The state of an address.
- **zip** [string] The zip code of an address.
- **name** [string] The full name of the resident at this address. If needed, separate multiple columns with +, e.g. *first\_name+last\_name*
- company [string] The name of the company located at this address.
- **use\_default\_column\_mapping** [boolean, optional] Defaults to true, where the existing column mapping on the input table will be used. If false, a custom column mapping must be provided.
- **perform\_ncoa** [boolean, optional] Whether to update addresses for records matching the National Change of Address (NCOA) database.
- **ncoa\_credential\_id** [integer, optional] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.
- output\_level [string, optional] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.
- **limiting\_sql** [string, optional] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

## Returns

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

**created at** [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

## author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

## schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

#### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

# source [dict::]

- database\_table [dict::]
  - schema [string] The schema name of the source table.
  - table [string] The name of the source table.
  - remote\_host\_id [integer] The ID of the database host for the table.
  - credential\_id [integer] The id of the credentials to be used when performing the enhancement.
  - multipart key [list] The source table primary key.

## destination [dict::]

- database table [dict::]
  - schema [string] The schema name for the output data.
  - table [string] The table name for the output data.

## column\_mapping [dict::]

- address1 [string] The first address line.
- address2 [string] The second address line.
- city [string] The city of an address.
- state [string] The state of an address.
- **zip** [string] The zip code of an address.
- **name** [string] The full name of the resident at this address. If needed, separate multiple columns with +, e.g. *first\_name+last\_name*
- company [string] The name of the company located at this address.
- **use\_default\_column\_mapping** [boolean] Defaults to true, where the existing column mapping on the input table will be used. If false, a custom column mapping must be provided.
- **perform\_ncoa** [boolean] Whether to update addresses for records matching the National Change of Address (NCOA) database.
- ncoa\_credential\_id [integer] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.
- output\_level [string] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.
- **limiting\_sql** [string] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

**archived** [string] The archival status of the requested item(s).

# $post\_cass\_ncoa\_cancel$ (id)

Cancel a run

#### **Parameters**

id [integer] The ID of the job.

# Returns

id [integer] The ID of the run.

state [string] The state of the run, one of 'queued', 'running' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

#### post\_cass\_ncoa\_runs(id)

Start a run

#### **Parameters**

id [integer] The ID of the cass\_ncoa.

## Returns

id [integer] The ID of the run.

**cass\_ncoa\_id** [integer] The ID of the cass\_ncoa.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is cancel requested [boolean] True if run cancel requested, else false.

**started at** [string/time] The time the last run started at.

**finished at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

```
post_civis_data_match (name, input_field_mapping, match_target_id, *, sched-
ule='DEFAULT', parent_id='DEFAULT', notifications='DEFAULT',
input_table='DEFAULT', input_file_id='DEFAULT', out-
put_table='DEFAULT', output_filename='DEFAULT',
max_matches='DEFAULT', threshold='DEFAULT')
```

Create a Civis Data Match Enhancement

#### **Parameters**

**name** [string] The name of the enhancement job.

**input\_field\_mapping** [dict] The column mapping for the input table/file. See /enhancements/field\_mapping for list of valid fields.

match\_target\_id [integer] The ID of the Civis Data match target. See /match\_targets for IDs.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**parent\_id** [integer, optional] Parent ID that triggers this enhancement.

**notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.

- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

input\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

input\_file\_id [integer, optional] The ID for the input file. This should be set if and
 only if inputTable and outputTable are not set.

output\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string, optional] The name of the output file. This should be set if and only if inputFileId is set.

**max\_matches** [integer, optional] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float, optional] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

#### Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

**created\_at** [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.
- **input\_field\_mapping** [dict] The column mapping for the input table/file. See /enhancements/field\_mapping for list of valid fields.

## input\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.
- match\_target\_id [integer] The ID of the Civis Data match target. See /match\_targets for IDs.

#### output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

```
output_filename [string] The name of the output file. This should be set if and only if inputFileId is set.
```

**max\_matches** [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

#### post civis data match cancel (id)

Cancel a run

#### **Parameters**

id [integer] The ID of the job.

#### Returns

id [integer] The ID of the run.

state [string] The state of the run, one of 'queued', 'running' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

#### post\_civis\_data\_match\_runs (id)

Start a run

#### **Parameters**

id [integer] The ID of the civis\_data\_match.

#### Returns

id [integer] The ID of the run.

civis\_data\_match\_id [integer] The ID of the civis\_data\_match.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

Create a Data Unification Enhancement

## **Parameters**

**name** [string] The name of the enhancement job.

**field\_mapping1** [dict] The column mapping for Table/File 1. See /enhance-ments/field\_mapping for list of valid fields.

**field\_mapping2** [dict] The column mapping for Table/File 2. See /enhance-ments/field\_mapping for list of valid fields.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.

- **scheduled\_hours** [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

**notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

table1 [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file1\_id** [integer, optional] The ID for File 1. This should be set if and only if table1, table2, and outputTable are not set.

table2 [dict, optional::]

- database name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file2\_id** [integer, optional] The ID for File 2. This should be set if and only if table1, table2, and outputTable is not set.

output\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string, optional] The name of the output file. This should be set if and only if file1Id and file2Id are set.

**max\_matches** [integer, optional] The maximum number of matches per record in Table/File 1 to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float, optional] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

#### Returns

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

type [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

## author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.

- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.
- **field\_mapping1** [dict] The column mapping for Table/File 1. See /enhance-ments/field\_mapping for list of valid fields.

#### table1 [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file1\_id** [integer] The ID for File 1. This should be set if and only if table1, table2, and outputTable are not set.
- **field\_mapping2** [dict] The column mapping for Table/File 2. See /enhance-ments/field\_mapping for list of valid fields.

## table2 [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file2\_id** [integer] The ID for File 2. This should be set if and only if table1, table2, and outputTable is not set.

#### output\_table [dict::]

- database name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- **table** [string] The table name.
- output\_filename [string] The name of the output file. This should be set if and only if file1Id and file2Id are set.
- max\_matches [integer] The maximum number of matches per record in Table/File 1 to return. Must be between 0 and 10. 0 returns all matches.
- **threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

# post data unification cancel (id) Cancel a run **Parameters** id [integer] The ID of the job. Returns id [integer] The ID of the run. **state** [string] The state of the run, one of 'queued', 'running' or 'cancelled'. **is\_cancel\_requested** [boolean] True if run cancel requested, else false. post\_data\_unification\_runs (id) Start a run **Parameters** id [integer] The ID of the data\_unification. Returns id [integer] The ID of the run. data unification id [integer] The ID of the data unification. state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'. is cancel requested [boolean] True if run cancel requested, else false. **started at** [string/time] The time the last run started at. finished\_at [string/time] The time the last run completed. **error** [string] The error, if any, returned by the run. post\_geocode (name, remote\_host\_id, credential\_id, source\_schema\_and\_table, \*, schedule='DEFAULT', parent\_id='DEFAULT', notifications='DEFAULT', part\_key='DEFAULT', limiting\_sql='DEFAULT', target\_schema='DEFAULT', target\_table='DEFAULT', country='DEFAULT', provider='DEFAULT', output\_address='DEFAULT') Create a Geocode Enhancement **Parameters name** [string] The name of the enhancement job. **remote host id** [integer] The ID of the remote host. **credential\_id** [integer] The ID of the remote host credential. **source\_schema\_and\_table** [string] The source database schema and table.

• scheduled [boolean] If the item is scheduled.

**schedule** [dict, optional::]

- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

#### **notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

multipart\_key [list, optional] The source table primary key.

**limiting\_sql** [string, optional] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

target\_schema [string, optional] The output table schema.

**target\_table** [string, optional] The output table name.

**country** [string, optional] The country of the addresses to be geocoded; either 'us' or 'ca'.

**provider** [string, optional] The geocoding provider; one of postgis, nominatim, and geocoder\_ca.

**output\_address** [boolean, optional] Whether to output the parsed address. Only guaranteed for the 'postgis' provider.

#### Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

#### author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.

• **online** [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

## schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**remote\_host\_id** [integer] The ID of the remote host.

**credential\_id** [integer] The ID of the remote host credential.

source\_schema\_and\_table [string] The source database schema and table.

**multipart\_key** [list] The source table primary key.

**limiting\_sql** [string] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

```
target_table [string] The output table name.
                  country [string] The country of the addresses to be geocoded; either 'us' or 'ca'.
                  provider [string] The geocoding provider; one of postgis, nominatim, and
                       geocoder ca.
                  output_address [boolean] Whether to output the parsed address. Only guaranteed for
                       the 'postgis' provider.
                  archived [string] The archival status of the requested item(s).
post_geocode_cancel(id)
     Cancel a run
           Parameters
                  id [integer] The ID of the job.
            Returns
                  id [integer] The ID of the run.
                  state [string] The state of the run, one of 'queued', 'running' or 'cancelled'.
                  is_cancel_requested [boolean] True if run cancel requested, else false.
post\_geocode\_runs(id)
      Start a run
           Parameters
                  id [integer] The ID of the geocode.
            Returns
                  id [integer] The ID of the run.
                  geocode_id [integer] The ID of the geocode.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                       'cancelled'.
                  is cancel requested [boolean] True if run cancel requested, else false.
                  started_at [string/time] The time the last run started at.
                  finished_at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
post_person_matching (name, configuration, *, schedule='DEFAULT', parent_id='DEFAULT',
                              notifications='DEFAULT')
     Create a Person Matching Enhancement
            Parameters
                  name [string] The name of the enhancement job.
                  configuration [dict::]
                         • task [string] The type of person matching task.
                                                                                 Options are: "ta-
                               ble_to_table", "dedupe_table", or "table_to_civis_data".
                         • source [string] The input source of your data. Options are: "redshift" or
                         • input_database_name [string] The Redshift database name for input data.
```

target\_schema [string] The output table schema.

- input\_schema [string] The schema name for the input data.
- input\_table [string] The table name for the input data.
- input\_file\_id [string] The ID of the input S3 file.
- **input\_field\_mapping** [string] The column mapping for the input in JSON or YAML.
- **input\_file\_headers** [string] Provide your headers in a list if the first row of your input does not have the headers, and make them JSON-decodable. For example: ["col1","col2","col3"].
- target\_database\_name [string] The Redshift database for target data.
- target\_schema [string] The schema for target data.
- target\_table [string] The table for target data.
- target\_field\_mapping [string] The column mapping for the target in JSON or YAML.
- target\_file\_id [string] The ID of the target S3 file.
- match\_target\_id [integer] The ID of the match target.
- match\_database\_name [string] The Redshift database for the match output table.
- match\_schema [string] The schema for the match output table.
- match\_table [string] The name of the match output table.
- match\_csv\_filename [string] The name of the match output file.
- match\_source\_id\_col [string] The name of the column in the output table that will hold the id from the source for each match.
- match\_target\_id\_col [string] The name the column in the output table that will hold the id from the target for each match.
- max\_matches [integer] The maximum number of matches to return.
- **threshold** [number/float] The score threshold (between 0 and 1).

## **schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

#### **notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

#### **Returns**

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

#### author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

## configuration [dict::]

- task [string] The type of person matching task. Options are: "table\_to\_table", "dedupe\_table", or "table\_to\_civis\_data".
- source [string] The input source of your data. Options are: "redshift" or "s3".
- input\_database\_name [string] The Redshift database name for input data.
- input\_schema [string] The schema name for the input data.
- **input\_table** [string] The table name for the input data.
- **input\_file\_id** [string] The ID of the input S3 file.
- **input\_field\_mapping** [string] The column mapping for the input in JSON or YAML.
- **input\_file\_headers** [string] Provide your headers in a list if the first row of your input does not have the headers, and make them JSON-decodable. For example: ["col1","col2","col3"].
- target\_database\_name [string] The Redshift database for target data.
- target\_schema [string] The schema for target data.
- target\_table [string] The table for target data.
- **target\_field\_mapping** [string] The column mapping for the target in JSON or YAML.
- target\_file\_id [string] The ID of the target S3 file.
- match target id [integer] The ID of the match target.

- match\_database\_name [string] The Redshift database for the match output table.
- match\_schema [string] The schema for the match output table.
- match\_table [string] The name of the match output table.
- match\_csv\_filename [string] The name of the match output file.
- match\_source\_id\_col [string] The name of the column in the output table that will hold the id from the source for each match.
- match\_target\_id\_col [string] The name the column in the output table that will hold the id from the target for each match.
- max\_matches [integer] The maximum number of matches to return.
- **threshold** [number/float] The score threshold (between 0 and 1).

```
post_person_matching_cancel(id)
```

Cancel a run

#### **Parameters**

**id** [integer] The ID of the job.

#### Returns

id [integer] The ID of the run.

**state** [string] The state of the run, one of 'queued', 'running' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

```
post_person_matching_runs(id)
```

Start a run

## **Parameters**

id [integer] The ID of the person\_matching.

#### Returns

id [integer] The ID of the run.

**person\_matching\_id** [integer] The ID of the person\_matching.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

**started at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

```
post_table_deduplication (name, input_field_mapping, *, schedule='DEFAULT', parent_id='DEFAULT', notifications='DEFAULT', in-put_table='DEFAULT', input_file_id='DEFAULT', out-put_table='DEFAULT', output_filename='DEFAULT', max_matches='DEFAULT', threshold='DEFAULT')
```

Create a Table Deduplication Enhancement

# **Parameters**

**name** [string] The name of the enhancement job.

**input\_field\_mapping** [dict] The column mapping for the input table. See /enhance-ments/field\_mapping for list of valid fields.

# schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

## notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# input\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

## output\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string, optional] The name of the output file. This should be set if and only if inputFileId is set.

max\_matches [integer, optional] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float, optional] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

#### Returns

**id** [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

**created\_at** [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

## author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

#### schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.

- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**input\_field\_mapping** [dict] The column mapping for the input table. See /enhance-ments/field\_mapping for list of valid fields.

# input\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.

## output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string] The name of the output file. This should be set if and only if inputFileId is set.

max\_matches [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

## post\_table\_deduplication\_cancel(id)

Cancel a run

#### **Parameters**

id [integer] The ID of the job.

#### Returns

id [integer] The ID of the run.

**state** [string] The state of the run, one of 'queued', 'running' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

# post\_table\_deduplication\_runs(id)

Start a run

#### **Parameters**

id [integer] The ID of the table\_deduplication.

#### Returns

id [integer] The ID of the run.

**table\_deduplication\_id** [integer] The ID of the table\_deduplication.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

started\_at [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

put\_cass\_ncoa (id, name, source, \*, schedule='DEFAULT', parent\_id='DEFAULT', notifications='DEFAULT', destination='DEFAULT', column\_mapping='DEFAULT',
use\_default\_column\_mapping='DEFAULT', perform\_ncoa='DEFAULT',
ncoa\_credential\_id='DEFAULT', output\_level='DEFAULT', limiting\_sql='DEFAULT')

Replace all attributes of this CASS/NCOA Enhancement

## **Parameters**

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

source [dict::]

- database table [dict::]
  - schema [string] The schema name of the source table.
  - **table** [string] The name of the source table.
  - remote\_host\_id [integer] The ID of the database host for the table.
  - credential\_id [integer] The id of the credentials to be used when performing the enhancement.
  - multipart\_key [list] The source table primary key.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# destination [dict, optional::]

- database table [dict::]
  - schema [string] The schema name for the output data.
  - table [string] The table name for the output data.

# column\_mapping [dict, optional::]

- address1 [string] The first address line.
- address2 [string] The second address line.
- city [string] The city of an address.
- state [string] The state of an address.
- **zip** [string] The zip code of an address.
- **name** [string] The full name of the resident at this address. If needed, separate multiple columns with +, e.g. *first\_name+last\_name*
- company [string] The name of the company located at this address.
- **use\_default\_column\_mapping** [boolean, optional] Defaults to true, where the existing column mapping on the input table will be used. If false, a custom column mapping must be provided.
- **perform\_ncoa** [boolean, optional] Whether to update addresses for records matching the National Change of Address (NCOA) database.
- **ncoa\_credential\_id** [integer, optional] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.
- output\_level [string, optional] The set of fields persisted by a CASS or NCOA enhancement.For CASS enhancements, one of 'cass' or 'all.'For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'.By default, all fields will be returned.
- **limiting\_sql** [string, optional] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

# Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.

- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

# source [dict::]

- database table [dict::]
  - schema [string] The schema name of the source table.
  - table [string] The name of the source table.
  - remote\_host\_id [integer] The ID of the database host for the table.
  - credential\_id [integer] The id of the credentials to be used when performing the enhancement.
  - multipart\_key [list] The source table primary key.

# destination [dict::]

- database\_table [dict::]
  - schema [string] The schema name for the output data.
  - table [string] The table name for the output data.

# column\_mapping [dict::]

- address1 [string] The first address line.
- address2 [string] The second address line.
- city [string] The city of an address.
- state [string] The state of an address.
- **zip** [string] The zip code of an address.
- **name** [string] The full name of the resident at this address. If needed, separate multiple columns with +, e.g. *first\_name+last\_name*
- **company** [string] The name of the company located at this address.
- **use\_default\_column\_mapping** [boolean] Defaults to true, where the existing column mapping on the input table will be used. If false, a custom column mapping must be provided.
- **perform\_ncoa** [boolean] Whether to update addresses for records matching the National Change of Address (NCOA) database.
- **ncoa\_credential\_id** [integer] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.
- output\_level [string] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.
- **limiting\_sql** [string] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

**archived** [string] The archival status of the requested item(s).

# put\_cass\_ncoa\_archive (id, status)

Update the archive status of this object

**Parameters** 

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

### Returns

**id** [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

type [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.

- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

# source [dict::]

- database\_table [dict::]
  - schema [string] The schema name of the source table.
  - **table** [string] The name of the source table.
  - remote\_host\_id [integer] The ID of the database host for the table.
  - credential\_id [integer] The id of the credentials to be used when performing the enhancement.
  - multipart\_key [list] The source table primary key.

## destination [dict::]

- database\_table [dict::]
  - schema [string] The schema name for the output data.
  - table [string] The table name for the output data.

# column\_mapping [dict::]

- address1 [string] The first address line.
- address2 [string] The second address line.
- city [string] The city of an address.
- state [string] The state of an address.
- zip [string] The zip code of an address.
- **name** [string] The full name of the resident at this address. If needed, separate multiple columns with +, e.g. *first name+last name*
- **company** [string] The name of the company located at this address.
- **use\_default\_column\_mapping** [boolean] Defaults to true, where the existing column mapping on the input table will be used. If false, a custom column mapping must be provided.
- **perform\_ncoa** [boolean] Whether to update addresses for records matching the National Change of Address (NCOA) database.
- **ncoa\_credential\_id** [integer] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.
- **output\_level** [string] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.

```
limiting_sql [string] The limiting SQL for the source table. "WHERE" should be
                       omitted (e.g. state='IL').
                  archived [string] The archival status of the requested item(s).
put_cass_ncoa_projects (id, project_id)
      Add a JobTypes::CassNcoa to a project
            Parameters
                  id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_cass_ncoa_shares_groups (id,
                                                          group_ids,
                                                                                   permission_level,
                                                                     share_email_body='DEFAULT',
                                        send_shared_email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                         • users [list::]
                               - id: integer
                               - name: string
                         • groups [list::]
                               - id: integer
                               - name : string
                  writers [dict::]
                         • users [list::]
                               - id: integer
                               - name: string
                         • groups [list::]
                               - id: integer
                               - name: string
                  owners [dict::]
                         • users [list::]
                               - id: integer
                               - name: string
```

```
- id: integer
                                - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                       and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.
put_cass_ncoa_shares_users (id,
                                                           user_ids,
                                                                                     permission_level,
                                                                      share_email_body='DEFAULT',
                                       send_shared_email='DEFAULT')
     Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send shared email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                          • users [list::]

```

• groups [list::]

6.5. API Client 183

- id: integer

- name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

Replace all attributes of this Civis Data Match Enhancement

### **Parameters**

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**input\_field\_mapping** [dict] The column mapping for the input table/file. See /enhancements/field\_mapping for list of valid fields.

match\_target\_id [integer] The ID of the Civis Data match target. See /match\_targets for IDs.

**schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled days [list] Day based on numeric value starting at 0 for Sunday.
- **scheduled\_hours** [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

**notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.

• failure\_on [boolean] If failure email notifications are on.

input table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

input\_file\_id [integer, optional] The ID for the input file. This should be set if and
 only if inputTable and outputTable are not set.

output\_table [dict, optional::]

- database name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string, optional] The name of the output file. This should be set if and only if inputFileId is set.

**max\_matches** [integer, optional] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float, optional] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

#### Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent id [integer] Parent ID that triggers this enhancement.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.
- **input\_field\_mapping** [dict] The column mapping for the input table/file. See /enhancements/field\_mapping for list of valid fields.

### input\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.
- match\_target\_id [integer] The ID of the Civis Data match target. See /match\_targets for IDs.

## output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **output\_filename** [string] The name of the output file. This should be set if and only if inputFileId is set.

**max\_matches** [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

# put\_civis\_data\_match\_archive (id, status)

Update the archive status of this object

#### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

#### **Returns**

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

**created\_at** [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

### schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."

- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.
- **input\_field\_mapping** [dict] The column mapping for the input table/file. See /enhancements/field\_mapping for list of valid fields.

## input\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.
- match\_target\_id [integer] The ID of the Civis Data match target. See /match\_targets for IDs.

# output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- output\_filename [string] The name of the output file. This should be set if and only if inputFileId is set.
- max\_matches [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.
- **threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

### put\_civis\_data\_match\_projects (id, project\_id)

Add a container docker to a project

# **Parameters**

id [integer] The ID of the resource.

**project id** [integer] The ID of the project.

#### Returns

```
None Response code 204: success
put_civis_data_match_shares_groups (id,
                                                               group_ids,
                                                                                   permission_level,
                                                                     share_email_body='DEFAULT',
                                                  send_shared_email='DEFAULT')
     Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns

ers and readers, the number of visible groups shared.

Replace all attributes of this Data Unification Enhancement

### **Parameters**

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**field\_mapping1** [dict] The column mapping for Table/File 1. See /enhance-ments/field\_mapping for list of valid fields.

**field\_mapping2** [dict] The column mapping for Table/File 2. See /enhance-ments/field\_mapping for list of valid fields.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

table1 [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.

• **table** [string] The table name.

**file1\_id** [integer, optional] The ID for File 1. This should be set if and only if table1, table2, and outputTable are not set.

table2 [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- **schema** [string] The schema name for the table.
- table [string] The table name.

**file2\_id** [integer, optional] The ID for File 2. This should be set if and only if table1, table2, and outputTable is not set.

output\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string, optional] The name of the output file. This should be set if and only if file1Id and file2Id are set.

max\_matches [integer, optional] The maximum number of matches per record in Table/File 1 to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float, optional] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

#### Returns

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

**created\_at** [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.

• **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.
- **field\_mapping1** [dict] The column mapping for Table/File 1. See /enhance-ments/field\_mapping for list of valid fields.

### table1 [dict::]

- database name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file1\_id** [integer] The ID for File 1. This should be set if and only if table1, table2, and outputTable are not set.
- **field\_mapping2** [dict] The column mapping for Table/File 2. See /enhance-ments/field\_mapping for list of valid fields.

# table2 [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.

• table [string] The table name.

**file2\_id** [integer] The ID for File 2. This should be set if and only if table1, table2, and outputTable is not set.

# output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string] The name of the output file. This should be set if and only if file1Id and file2Id are set.

max\_matches [integer] The maximum number of matches per record in Table/File 1 to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

### put data unification archive (id, status)

Update the archive status of this object

#### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

#### Returns

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

## author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- **scheduled\_hours** [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.
- **field\_mapping1** [dict] The column mapping for Table/File 1. See /enhance-ments/field\_mapping for list of valid fields.

# table1 [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **file1\_id** [integer] The ID for File 1. This should be set if and only if table1, table2, and outputTable are not set.
- **field\_mapping2** [dict] The column mapping for Table/File 2. See /enhance-ments/field\_mapping for list of valid fields.

### table2 [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- **table** [string] The table name.

```
file2_id [integer] The ID for File 2. This should be set if and only if table1, table2, and outputTable is not set.
```

```
output_table [dict::]
```

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string] The name of the output file. This should be set if and only if file1Id and file2Id are set.

**max\_matches** [integer] The maximum number of matches per record in Table/File 1 to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

# put\_data\_unification\_projects (id, project\_id)

Add a container docker to a project

#### **Parameters**

id [integer] The ID of the resource.

project\_id [integer] The ID of the project.

### Returns

None Response code 204: success

```
\begin{tabular}{lll} \textbf{put\_data\_unification\_shares\_groups} (id, & group\_ids, & permission\_level, \\ *, & share\_email\_body='DEFAULT', \\ & send\_shared\_email='DEFAULT') \end{tabular}
```

Set the permissions groups has on this object

## **Parameters**

id [integer] The ID of the resource that is shared.

**group\_ids** [list] An array of one or more group IDs.

**permission\_level** [string] Options are: "read", "write", or "manage".

**share\_email\_body** [string, optional] Custom body text for e-mail sent on a share.

send shared email [boolean, optional] Send email to the recipients of a share.

#### Returns

```
readers [dict::]
```

- users [list::]
  - id: integer
  - name : string
- groups [list::]
  - id: integer
  - name: string

# writers [dict::]

  - id: integer
  - name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

put\_geocode (id, name, remote\_host\_id, credential\_id, source\_schema\_and\_table, \*, schedule='DEFAULT', parent\_id='DEFAULT', notifications='DEFAULT', multipart\_key='DEFAULT', limiting\_sql='DEFAULT', target\_schema='DEFAULT', target\_table='DEFAULT', country='DEFAULT', provider='DEFAULT', output address='DEFAULT')

Replace all attributes of this Geocode Enhancement

### **Parameters**

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

remote\_host\_id [integer] The ID of the remote host.

credential\_id [integer] The ID of the remote host credential.

**source\_schema\_and\_table** [string] The source database schema and table.

**schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.

- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

multipart\_key [list, optional] The source table primary key.

**limiting\_sql** [string, optional] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

target\_schema [string, optional] The output table schema.

**target\_table** [string, optional] The output table name.

**country** [string, optional] The country of the addresses to be geocoded; either 'us' or 'ca'.

**provider** [string, optional] The geocoding provider; one of postgis, nominatim, and geocoder\_ca.

**output\_address** [boolean, optional] Whether to output the parsed address. Only guaranteed for the 'postgis' provider.

# Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

**created\_at** [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.

• **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**remote\_host\_id** [integer] The ID of the remote host.

credential\_id [integer] The ID of the remote host credential.

**source\_schema\_and\_table** [string] The source database schema and table.

multipart key [list] The source table primary key.

**limiting\_sql** [string] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

target\_schema [string] The output table schema.

**target\_table** [string] The output table name.

**country** [string] The country of the addresses to be geocoded; either 'us' or 'ca'.

**provider** [string] The geocoding provider; one of postgis, nominatim, and geocoder\_ca.

**output\_address** [boolean] Whether to output the parsed address. Only guaranteed for the 'postgis' provider.

**archived** [string] The archival status of the requested item(s).

### put\_geocode\_archive (id, status)

Update the archive status of this object

# **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

#### Returns

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.

- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**remote\_host\_id** [integer] The ID of the remote host.

**credential\_id** [integer] The ID of the remote host credential.

**source\_schema\_and\_table** [string] The source database schema and table.

multipart\_key [list] The source table primary key.

**limiting\_sql** [string] The limiting SQL for the source table. "WHERE" should be omitted (e.g. state='IL').

target\_schema [string] The output table schema.

target\_table [string] The output table name.

**country** [string] The country of the addresses to be geocoded; either 'us' or 'ca'.

**provider** [string] The geocoding provider; one of postgis, nominatim, and geocoder\_ca.

**output\_address** [boolean] Whether to output the parsed address. Only guaranteed for the 'postgis' provider.

**archived** [string] The archival status of the requested item(s).

```
put_geocode_projects (id, project_id)
```

Add a JobTypes::Geocode to a project

### **Parameters**

id [integer] The ID of the resource.

project\_id [integer] The ID of the project.

## Returns

None Response code 204: success

send\_shared\_email='DEFAULT')

Set the permissions groups has on this object

### Parameters

id [integer] The ID of the resource that is shared.

group\_ids [list] An array of one or more group IDs.

```
share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer
                                - name: string
                  writers [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]

       • users [list::]
              - id: integer
              - name: string
        • groups [list::]
```

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

Replace all attributes of this Person Matching Enhancement

## **Parameters**

**id** [integer] The ID for the enhancement.

id : integername : string

**name** [string] The name of the enhancement job.

# configuration [dict::]

- task [string] The type of person matching task. Options are: "table\_to\_table", "dedupe\_table", or "table\_to\_civis\_data".
- source [string] The input source of your data. Options are: "redshift" or "s3".
- input\_database\_name [string] The Redshift database name for input data.
- input\_schema [string] The schema name for the input data.

- **input\_table** [string] The table name for the input data.
- input\_file\_id [string] The ID of the input S3 file.
- input\_field\_mapping [string] The column mapping for the input in JSON or YAML.
- **input\_file\_headers** [string] Provide your headers in a list if the first row of your input does not have the headers, and make them JSON-decodable. For example: ["col1","col2","col3"].
- target\_database\_name [string] The Redshift database for target data.
- target\_schema [string] The schema for target data.
- target\_table [string] The table for target data.
- **target\_field\_mapping** [string] The column mapping for the target in JSON or YAML.
- target\_file\_id [string] The ID of the target S3 file.
- match\_target\_id [integer] The ID of the match target.
- match\_database\_name [string] The Redshift database for the match output table.
- match\_schema [string] The schema for the match output table.
- match\_table [string] The name of the match output table.
- match\_csv\_filename [string] The name of the match output file.
- match\_source\_id\_col [string] The name of the column in the output table that will hold the id from the source for each match.
- match\_target\_id\_col [string] The name the column in the output table that will hold the id from the target for each match.
- max\_matches [integer] The maximum number of matches to return.
- **threshold** [number/float] The score threshold (between 0 and 1).

### **schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

### notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### **Returns**

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

**updated at** [string/time] The time the enhancement was last updated.

### author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

# configuration [dict::]

- task [string] The type of person matching task. Options are: "table\_to\_table", "dedupe\_table", or "table\_to\_civis\_data".
- source [string] The input source of your data. Options are: "redshift" or "s3".
- input\_database\_name [string] The Redshift database name for input data.
- input\_schema [string] The schema name for the input data.
- **input\_table** [string] The table name for the input data.
- input\_file\_id [string] The ID of the input S3 file.
- **input\_field\_mapping** [string] The column mapping for the input in JSON or YAML.
- **input\_file\_headers** [string] Provide your headers in a list if the first row of your input does not have the headers, and make them JSON-decodable. For example: ["col1","col2","col3"].
- target\_database\_name [string] The Redshift database for target data.
- target\_schema [string] The schema for target data.
- target\_table [string] The table for target data.
- **target\_field\_mapping** [string] The column mapping for the target in JSON or YAML.
- target\_file\_id [string] The ID of the target S3 file.
- match target id [integer] The ID of the match target.

- match\_database\_name [string] The Redshift database for the match output table.
- match\_schema [string] The schema for the match output table.
- match\_table [string] The name of the match output table.
- match\_csv\_filename [string] The name of the match output file.
- match\_source\_id\_col [string] The name of the column in the output table that will hold the id from the source for each match.
- match\_target\_id\_col [string] The name the column in the output table that will hold the id from the target for each match.
- max\_matches [integer] The maximum number of matches to return.
- **threshold** [number/float] The score threshold (between 0 and 1).

## put\_person\_matching\_archive (id, status)

Update the archive status of this object

### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

### Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**type** [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

## author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the enhancement's last run

#### schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

```
notifications [dict::]
```

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

## configuration [dict::]

- task [string] The type of person matching task. Options are: "table\_to\_table", "dedupe\_table", or "table\_to\_civis\_data".
- source [string] The input source of your data. Options are: "redshift" or "s3"
- input\_database\_name [string] The Redshift database name for input data.
- input\_schema [string] The schema name for the input data.
- input\_table [string] The table name for the input data.
- input\_file\_id [string] The ID of the input S3 file.
- **input\_field\_mapping** [string] The column mapping for the input in JSON or YAML.
- **input\_file\_headers** [string] Provide your headers in a list if the first row of your input does not have the headers, and make them JSON-decodable. For example: ["col1","col2","col3"].
- target\_database\_name [string] The Redshift database for target data.
- target\_schema [string] The schema for target data.
- target table [string] The table for target data.

- **target\_field\_mapping** [string] The column mapping for the target in JSON or YAML.
- target\_file\_id [string] The ID of the target S3 file.
- match\_target\_id [integer] The ID of the match target.
- match\_database\_name [string] The Redshift database for the match output table.
- match\_schema [string] The schema for the match output table.
- match\_table [string] The name of the match output table.
- match\_csv\_filename [string] The name of the match output file.
- match\_source\_id\_col [string] The name of the column in the output table that will hold the id from the source for each match.
- match\_target\_id\_col [string] The name the column in the output table that will hold the id from the target for each match.
- max\_matches [integer] The maximum number of matches to return.
- **threshold** [number/float] The score threshold (between 0 and 1).

```
put_person_matching_projects (id, project_id)
```

Add a container docker to a project

## **Parameters**

```
id [integer] The ID of the resource.
```

```
project_id [integer] The ID of the project.
```

# Returns

None Response code 204: success

Set the permissions groups has on this object

# **Parameters**

id [integer] The ID of the resource that is shared.

group ids [list] An array of one or more group IDs.

**permission level** [string] Options are: "read", "write", or "manage".

**share email body** [string, optional] Custom body text for e-mail sent on a share.

**send\_shared\_email** [boolean, optional] Send email to the recipients of a share.

## Returns

readers [dict::]

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id: integer
  - name: string

```
writers [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer

```

Replace all attributes of this Table Deduplication Enhancement

## **Parameters**

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

**input\_field\_mapping** [dict] The column mapping for the input table. See /enhance-ments/field\_mapping for list of valid fields.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] Parent ID that triggers this enhancement.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

input\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**input\_file\_id** [integer, optional] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.

output\_table [dict, optional::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- **table** [string] The table name.

**output\_filename** [string, optional] The name of the output file. This should be set if and only if inputFileId is set.

**max\_matches** [integer, optional] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float, optional] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

#### Returns

id [integer] The ID for the enhancement.

**name** [string] The name of the enhancement job.

type [string] The type of the enhancement (e.g CASS-NCOA)

created\_at [string/time] The time this enhancement was created.

updated\_at [string/time] The time the enhancement was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.

• **online** [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**input\_field\_mapping** [dict] The column mapping for the input table. See /enhance-ments/field\_mapping for list of valid fields.

# input\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.

# output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

**output\_filename** [string] The name of the output file. This should be set if and only if inputFileId is set.

max\_matches [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

**threshold** [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned.

# put\_table\_deduplication\_archive (id, status)

Update the archive status of this object

#### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

#### Returns

id [integer] The ID for the enhancement.

name [string] The name of the enhancement job.

type [string] The type of the enhancement (e.g CASS-NCOA)

**created\_at** [string/time] The time this enhancement was created.

**updated\_at** [string/time] The time the enhancement was last updated.

## author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the enhancement's last run

## schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] Parent ID that triggers this enhancement.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**input\_field\_mapping** [dict] The column mapping for the input table. See /enhance-ments/field\_mapping for list of valid fields.

## input\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.

input\_file\_id [integer] The ID for the input file. This should be set if and only if inputTable and outputTable are not set.

# output\_table [dict::]

- database\_name [string] The Redshift database name for the table.
- schema [string] The schema name for the table.
- table [string] The table name.
- **output\_filename** [string] The name of the output file. This should be set if and only if inputFileId is set.

max\_matches [integer] The maximum number of matches per record in the input table/file to return. Must be between 0 and 10. 0 returns all matches.

threshold [number/float] The score threshold (between 0 and 1). Matches below this threshold will not be returned. put\_table\_deduplication\_projects (id, project\_id) Add a container docker to a project **Parameters** id [integer] The ID of the resource. project\_id [integer] The ID of the project. **Returns** None Response code 204: success put\_table\_deduplication\_shares\_groups (id, permission\_level, group\_ids, share\_email\_body='DEFAULT', send\_shared\_email='DEFAULT') Set the permissions groups has on this object **Parameters** id [integer] The ID of the resource that is shared. group\_ids [list] An array of one or more group IDs. permission\_level [string] Options are: "read", "write", or "manage". **share\_email\_body** [string, optional] Custom body text for e-mail sent on a share. send\_shared\_email [boolean, optional] Send email to the recipients of a share. Returns readers [dict::] • users [list::] - id: integer - name: string • groups [list::] - id: integer - name: string writers [dict::] • users [list::] - id: integer - name: string • groups [list::] - id: integer - name: string owners [dict::] • users [list::] - id: integer - name: string

#### **Methods**

#### **Parameters**

**type** [string, optional] If specified, return exports of these types. It accepts a commaseparated list, possible values are 'database' and 'gdoc'.

**author** [string, optional] If specified, return exports from this author. It accepts a comma-separated list of author ids.

**status** [string, optional] If specified, returns export with one of these statuses. It accepts a comma-separated list, possible values are 'running', 'failed', 'succeeded', 'idle', 'scheduled'.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

archived [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at, last\_run.updated\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

id [integer] The ID for this export.

name [string] The name of this export.

**type** [string] The type of export.

created\_at [string/time] The creation time for this export.

state [string]

```
last_run [dict::]
                               • id: integer
                               • state: string
                               • created_at [string/time] The time that the run was queued.
                               • started_at [string/time] The time that the run started.
                               • finished_at [string/time] The time that the run completed.
                               • error [string] The error message for this run, if present.
                        author [dict::]
                               • id [integer] The ID of this user.
                               • name [string] This user's name.
                               • username [string] This user's username.
                               • initials [string] This user's initials.
                               • online [boolean] Whether this user is online.
class Files (session_kwargs, return_type='civis')
     Methods
     delete_projects (id, project_id)
           Remove a Data::S3File from a project
                 Parameters
                        id [integer] The ID of the resource.
                        project_id [integer] The ID of the project.
                  Returns
                        None Response code 204: success
     delete_shares_groups (id, group_id)
           Revoke the permissions a group has on this object
                  Parameters
                        id [integer] The ID of the resource that is shared.
                        group_id [integer] The ID of the group.
                  Returns
                        None Response code 204: success
     delete_shares_users (id, user_id)
           Revoke the permissions a user has on this object
```

**updated\_at** [string/time] The last modification time for this export.

**Files** 

## **Parameters**

```
id [integer] The ID of the resource that is shared.
```

user\_id [integer] The ID of the user.

#### **Returns**

None Response code 204: success

get (id, \*, link\_expires\_at='DEFAULT', inline='DEFAULT')
Get details about a file

#### **Parameters**

id [integer] The ID of the file.

**link\_expires\_at** [string, optional] The date and time the download link will expire. Must be a time between now and 36 hours from now. Defaults to 30 minutes from now.

inline [boolean, optional] If true, will return a url that can be displayed inline in HTML

#### Returns

id [integer] The ID of the file.

name [string] The file name.

**created\_at** [string/date-time] The date and time the file was created.

file\_size [integer] The file size.

**expires\_at** [string/date-time] The date and time the file will expire. If not specified, the file will expire in 30 days. To keep a file indefinitely, specify null.

# author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**download\_url** [string] A JSON string containing information about the URL of the file.

file\_url [string] The URL that may be used to download the file.

list\_projects(id, \*, hidden='DEFAULT')

List the projects a Data::S3File belongs to

#### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

# Returns

id [integer] The ID for this project.

author [dict::]

• id [integer] The ID of this user.

```
• name [string] This user's name.
                          • username [string] This user's username.
                          • initials [string] This user's initials.
                          • online [boolean] Whether this user is online.
                  name [string] The name of this project.
                  description [string] A description of the project.
                  users [list::] Users who can see the project. - id: integer
                            The ID of this user.
                          • name [string] This user's name.
                          • username [string] This user's username.
                          • initials [string] This user's initials.
                          • online [boolean] Whether this user is online.
                  auto_share [boolean]
                  created_at [string/time]
                  updated_at [string/time]
                  archived [string] The archival status of the requested item(s).
list_shares (id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                          • users [list::]
                                - id: integer
                                - name : string
                          • groups [list::]
                                - id: integer
                                - name: string
                  writers [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer
                                - name: string
                  owners [dict::]
```

```
• users [list::]
```

- id: integer

- name: string

• groups [list::]

- id: integer

- name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

post (name, \*, expires\_at='DEFAULT')

Initiate an upload of a file into the platform

#### **Parameters**

name [string] The file name.

**expires\_at** [string/date-time, optional] The date and time the file will expire. If not specified, the file will expire in 30 days. To keep a file indefinitely, specify null.

## Returns

id [integer] The ID of the file.

name [string] The file name.

created\_at [string/date-time] The date and time the file was created.

file\_size [integer] The file size.

**expires\_at** [string/date-time] The date and time the file will expire. If not specified, the file will expire in 30 days. To keep a file indefinitely, specify null.

**upload\_url** [string] The URL that may be used to upload a file. To use the upload URL, initiate a POST request to the given URL with the file you wish to import as the "file" form field.

**upload\_fields** [dict] A hash containing the form fields to be included with the POST request.

post\_multipart (name, num\_parts, \*, expires\_at='DEFAULT')

Initiate a multipart upload

#### **Parameters**

name [string] The file name.

**num\_parts** [integer] The number of parts in which the file will be uploaded. This parameter determines the number of presigned URLs that are returned.

**expires\_at** [string/date-time, optional] The date and time the file will expire. If not specified, the file will expire in 30 days. To keep a file indefinitely, specify null.

#### Returns

id [integer] The ID of the file.

**name** [string] The file name.

created\_at [string/date-time] The date and time the file was created.

file\_size [integer] The file size.

```
expires_at [string/date-time] The date and time the file will expire. If not specified,
                       the file will expire in 30 days. To keep a file indefinitely, specify null.
                  upload_urls [list] An array of URLs that may be used to upload file parts. Use sepa-
                       rate PUT requests to complete the part uploads. Links expire after 12 hours.
post_multipart_complete(id)
     Complete a multipart upload
           Parameters
                  id [integer] The ID of the file.
            Returns
                  None Response code 204: success
put_projects (id, project_id)
      Add a Data::S3File to a project
           Parameters
                  id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
                                                               *, share_email_body='DEFAULT',
put_shares_groups (id, group_ids, permission_level,
                         send shared email='DEFAULT')
     Set the permissions groups has on this object
           Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                         • users [list::]
                               - id: integer
                               - name: string
                         • groups [list::]
                               - id: integer
                               - name: string
                  writers [dict::]
                         • users [list::]
                               - id: integer
                               - name: string
```

```
• groups [list::]
                                - id: integer
                                - name: string
                  owners [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer
                                - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                       and readers, the number of visible users shared.
                  total group shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.
put_shares_users (id,
                               user_ids,
                                           permission_level,
                                                                      share_email_body='DEFAULT',
                        send shared email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer
                                - name: string
                  writers [dict::]
                          • users [list::]
                                - id: integer
                                - name: string
                          • groups [list::]
                                - id: integer
```

6.5. API Client 225

- name: string

#### owners [dict::]

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id: integer
  - name: string
- **total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.
- **total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

# **Groups**

class Groups (session\_kwargs, return\_type='civis')

#### **Methods**

## **Parameters**

- **query** [string, optional] If specified, it will filter the groups returned. Prefix matching is supported (e.g., "query=group" will return "group" and "group of people", but not "my group".
- **permission** [string, optional] A permissions string, one of "read", "write", or "manage". Lists only groups for which the current user has that permission.
- **limit** [integer, optional] Number of results to return. Defaults to 50. Maximum allowed is 1000.
- **page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.
- **order** [string, optional] The field on which to order the result set. Defaults to name. Must be one of: name, created\_at.
- **order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.
- **iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

# Returns

**id** [integer] The ID of this group.

name [string] This group's name.

```
created_at [string/time] The date and time when this group was created.
                       slug [string] The slug for this group.
                       organization_id [integer] The organization associated with this group.
class Imports (session_kwargs, return_type='civis')
     Methods
     delete_files_runs (id, run_id)
           Cancel a run
                 Parameters
                       id [integer] The ID of the import.
                       run_id [integer] The ID of the run.
                 Returns
                       None Response code 202: success
     delete_projects (id, project_id)
           Remove a JobTypes::Import from a project
                 Parameters
                       id [integer] The ID of the resource.
                       project_id [integer] The ID of the project.
                 Returns
                       None Response code 204: success
     delete_shares_groups (id, group_id)
           Revoke the permissions a group has on this object
                 Parameters
                       id [integer] The ID of the resource that is shared.
                       group_id [integer] The ID of the group.
                 Returns
                       None Response code 204: success
     delete_shares_users (id, user_id)
           Revoke the permissions a user has on this object
                 Parameters
                       id [integer] The ID of the resource that is shared.
                       user_id [integer] The ID of the user.
                 Returns
                       None Response code 204: success
```

**Imports** 

#### get (id)

Get details about an import

#### **Parameters**

id [integer] The ID for the import.

## Returns

name [string] The name of the import.

sync\_type [string] The type of sync to perform; one of Dbsync, AutoImport, Silver-popDataImport, SilverpopContactImport, GdocImport, GdocExport, and Salesforce

## source [dict::]

- remote\_host\_id : integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.
- name: string

## destination [dict::]

- remote\_host\_id : integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.
- name : string

## schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- success\_email\_addresses [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."

- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this
  amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

parent\_id [integer] Parent id to trigger this import from

id [integer] The ID for the import.

is\_outbound [boolean]

job\_type [string] The job type of this import.

**syncs** [list::] List of syncs. - id : integer - source : dict:

```
- id : integer
   The ID of the table or file, if available.
- path : string
   The path of the dataset to sync from; for a database_
⇔source,
   schema.tablename. If you are doing a Google Sheet_
⇔export, this can
   be blank. This is a legacy parameter, it is_
→recommended you use one
   of the following: databaseTable, file, googleWorksheet,
→ salesforce,
   silverpop
- database_table : dict::
   - schema : string
       The database schema name.
   - table : string
       The database table name.
   - use_without_schema : boolean
       If true, the table has no schema. Defaults to...
⇔false.
- file : dict::
   - id : integer
       The file id.
- google_worksheet : dict::
   - spreadsheet : string
       The spreadsheet document name.
   - worksheet : string
       The worksheet tab name.
- salesforce : dict::
   - object_name : string
       The Salesforce object name.
- silverpop : dict::
   - list id : integer
       The Silverpop list id.
```

• destination [dict::]

- path [string] The schema.tablename to sync to. If you are doing a Google Sheet export, this is the spreadsheet and sheet name separated by a period. i.e. if you have a spreadsheet named "MySpreadsheet" and a sheet called "Sheet1" this field would be "MySpreadsheet.Sheet1". This is a legacy parameter, it is recommended you use one of the following: databaseTable, googleWorksheet
- database\_table [dict::]
  - \* schema [string] The database schema name.
  - \* table [string] The database table name.
  - \* **use\_without\_schema** [boolean] If true, the table has no schema. Defaults to false.
- google\_worksheet [dict::]
  - \* spreadsheet [string] The spreadsheet document name.
  - \* worksheet [string] The worksheet tab name.
- advanced\_options [dict::]
  - max\_errors : integer
  - existing\_table\_rows : string
  - diststyle : string
  - distkey: string
  - sortkey1: string
  - sortkey2: string
  - column\_delimiter : string
  - column\_overrides [dict] Hash used for overriding auto-detected names and types, with keys being the index of the column being overridden.
  - escaped [boolean] If true, escape quotes with a backslash; otherwise, escape quotes by double-quoting. Defaults to false.
  - identity\_column : string
  - row\_chunk\_size : integer
  - wipe\_destination\_table : boolean
  - truncate\_long\_lines : boolean
  - invalid\_char\_replacement : string
  - verify\_table\_row\_counts : boolean
  - partition\_column\_name : string
  - partition\_schema\_name : string
  - partition\_table\_name : string
  - partition\_table\_partition\_column\_min\_name : string
  - partition\_table\_partition\_column\_max\_name : string
  - last modified column: string

- mysql\_catalog\_matches\_schema : boolean
- chunking\_method [string] The method used to break the data into smaller chunks for transfer. The value can be set to sorted\_by\_identity\_columns or if not set the chunking method will be choosen automatically.
- first row is header: boolean
- export\_action [string] The kind of export action you want to have the export execute. Set to "newsprsht" if you want a new worksheet inside a new spreadsheet. Set to "newwksht" if you want a new worksheet inside an existing spreadsheet. Set to "updatewksht" if you want to overwrite an existing worksheet inside an existing spreadsheet. Set to "appendwksht" if you want to append to the end of an existing worksheet inside an existing spreadsheet.
- sql\_query [string] If you are doing a Google Sheet export, this is your SQL query.
- contact\_lists : string
- soql\_query : string

## state [string]

created\_at [string/date-time]

updated\_at [string/date-time]

# last\_run [dict::]

- id: integer
- state : string
- created\_at [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

## user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.

```
• online [boolean] Whether this user is online.
```

**next run at** [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this import.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

#### get batches (id)

Get details about a batch import

#### **Parameters**

id [integer] The ID for the import.

#### Returns

id [integer] The ID for the import.

**schema** [string] The destination schema name. This schema must already exist in Redshift.

**table** [string] The destination table name, without the schema prefix. This table must already exist in Redshift.

**remote\_host\_id** [integer] The ID of the destination database host.

**state** [string] The state of the run; one of "queued", "running", "succeeded", "failed", or "cancelled".

**started at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error returned by the run, if any.

**hidden** [boolean] The hidden status of the item.

# $\mathtt{get\_files\_runs}$ $(id, run\_id)$

Check status of a run

# **Parameters**

id [integer] The ID of the import.

run id [integer] The ID of the run.

#### Returns

id [integer] The ID of the run.

**import\_id** [integer] The ID of the import.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started at** [string/time] The time the last run started at.

**finished at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

list (\*, type='DEFAULT', author='DEFAULT', destination='DEFAULT', source='DEFAULT', status='DEFAULT', hidden='DEFAULT', archived='DEFAULT', limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')
List

#### **Parameters**

**type** [string, optional] If specified, return imports of these types. It accepts a comma-separated list, possible values are 'AutoImport', 'DbSync', 'Salesforce', 'GdocImport'.

**author** [string, optional] If specified, return imports from this author. It accepts a comma-separated list of author ids.

**destination** [string, optional] If specified, returns imports with one of these destinations. It accepts a comma-separated list of remote host ids.

**source** [string, optional] If specified, returns imports with one of these sources. It accepts a comma-separated list of remote host ids. 'DbSync' must be specified for 'type'.

**status** [string, optional] If specified, returns imports with one of these statuses. It accepts a comma-separated list, possible values are 'running', 'failed', 'succeeded', 'idle', 'scheduled'.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

archived [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at, last\_run.updated\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### **Returns**

**name** [string] The name of the import.

sync\_type [string] The type of sync to perform; one of Dbsync, AutoImport, Silver-popDataImport, SilverpopContactImport, GdocImport, GdocExport, and Salesforce.

# source [dict::]

- remote\_host\_id : integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.
- name : string

## destination [dict::]

- remote\_host\_id : integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.
- name: string

#### schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

id [integer] The ID for the import.

is outbound [boolean]

**job type** [string] The job type of this import.

```
state [string]
created_at [string/date-time]
updated_at [string/date-time]
last_run [dict::]
```

- id: integer
- state: string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

## user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**time\_zone** [string] The time zone of this import.

**archived** [string] The archival status of the requested item(s).

# Parameters

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

## Returns

**id** [integer] The ID for the import.

**schema** [string] The destination schema name. This schema must already exist in Redshift.

**table** [string] The destination table name, without the schema prefix. This table must already exist in Redshift.

**remote\_host\_id** [integer] The ID of the destination database host.

**state** [string] The state of the run; one of "queued", "running", "succeeded", "failed", or "cancelled".

started\_at [string/time] The time the last run started at.

finished\_at [string/time] The time the last run completed.

**error** [string] The error returned by the run, if any.

list\_files\_runs(id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order='DEFAULT', iterator='DEFAULT')

List runs for the given import

#### **Parameters**

**id** [integer] The ID of the import.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

id [integer] The ID of the run.

import\_id [integer] The ID of the import.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

error [string] The error, if any, returned by the run.

# list\_files\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')

Get the logs for a run

## **Parameters**

id [integer] The ID of the import.

run\_id [integer] The ID of the run.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

# Returns

id [integer] The ID of the log.

created\_at [string/date-time] The time the log was created.

message [string] The log message.

**level** [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

# list\_projects (id, \*, hidden='DEFAULT')

List the projects a JobTypes::Import belongs to

## **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

## Returns

id [integer] The ID for this project.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.

```
• initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  name [string] The name of this project.
                  description [string] A description of the project.
                  users [list::] Users who can see the project. - id : integer
                              The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  auto_share [boolean]
                  created_at [string/time]
                  updated_at [string/time]
                  archived [string] The archival status of the requested item(s).
list runs (id)
      Get the run history of this import
            Parameters
                  id [integer]
            Returns
                  id [integer]
                  state [string]
                  created_at [string/time] The time that the run was queued.
                  started_at [string/time] The time that the run started.
                  finished_at [string/time] The time that the run completed.
                  error [string] The error message for this run, if present.
list_runs_logs (id, run_id, *, last_id='DEFAULT', limit='DEFAULT')
      Get the logs for a run
            Parameters
                  id [integer] The ID of the import.
                  run id [integer] The ID of the run.
                  last_id [integer, optional] The ID of the last log message received. Log entries with
                        this ID value or lower will be omitted. Logs are sorted by ID if this value is
                        provided, and are otherwise sorted by createdAt.
                  limit [integer, optional] The maximum number of log messages to return. Default of
                        10000.
            Returns
                  id [integer] The ID of the log.
                  created at [string/date-time] The time the log was created.
                  message [string] The log message.
                  level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.
list_shares (id)
      List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
```

```
- id: integer
                   - name : string
          • groups [list::]
                   - id: integer
                   - name: string
writers [dict::]
          • users [list::]
                    - id: integer
                   - name: string
          • groups [list::]
                    - id: integer
                   - name: string
owners [dict::]
          • users [list::]
                   - id: integer
                    - name: string
```

• groups [list::]

- id: integer

- name : string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

post (name, sync\_type, is\_outbound, \*, source='DEFAULT', destination='DEFAULT', schedule='DEFAULT', notifications='DEFAULT', parent\_id='DEFAULT', next\_run\_at='DEFAULT', time\_zone='DEFAULT', hidden='DEFAULT') Create a new import configuration

# **Parameters**

name [string] The name of the import.

**sync\_type** [string] The type of sync to perform; one of Dbsync, AutoImport, SilverpopDataImport, SilverpopContactImport, GdocImport, GdocExport, and Salesforce.

is\_outbound [boolean]
source [dict, optional::]

• remote\_host\_id : integer

• credential\_id : integer

 additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.

destination [dict, optional::]

• remote\_host\_id : integer

• credential\_id : integer

• additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

parent id [integer, optional] Parent id to trigger this import from

**next\_run\_at** [string/time, optional] The time of the next scheduled run.

time zone [string, optional] The time zone of this import.

**hidden** [boolean, optional] The hidden status of the item.

#### Returns

**name** [string] The name of the import.

sync\_type [string] The type of sync to perform; one of Dbsync, AutoImport, Silver-popDataImport, SilverpopContactImport, GdocImport, GdocExport, and Salesforce.

# source [dict::]

- remote\_host\_id : integer
- credential id: integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.
- name : string

# destination [dict::]

- name : string

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

parent\_id [integer] Parent id to trigger this import from

id [integer] The ID for the import.

is\_outbound [boolean]

**job\_type** [string] The job type of this import.

syncs [list::] List of syncs. - id : integer - source : dict:

```
- id : integer

The ID of the table or file, if available.

- path : string

The path of the dataset to sync from; for a database of the path of the dataset to sync from; for a database of the path of the dataset to sync from; for a database of the path of the dataset to sync from; for a database of the path of the
```

(continued from previous page)

```
be blank. This is a legacy parameter, it is_
→recommended you use one
   of the following: databaseTable, file, googleWorksheet,
→ salesforce,
    silverpop
- database_table : dict::
    - schema : string
       The database schema name.
    - table : string
       The database table name.
    - use_without_schema : boolean
       If true, the table has no schema. Defaults to
→false.
- file : dict::
    - id : integer
       The file id.
- google_worksheet : dict::
    - spreadsheet : string
       The spreadsheet document name.
    - worksheet : string
       The worksheet tab name.
- salesforce : dict::
    - object_name : string
       The Salesforce object name.
- silverpop : dict::
    - list_id : integer
        The Silverpop list id.
```

# • destination [dict::]

- path [string] The schema.tablename to sync to. If you are doing a Google Sheet export, this is the spreadsheet and sheet name separated by a period. i.e. if you have a spreadsheet named "MySpreadsheet" and a sheet called "Sheet1" this field would be "MySpreadsheet.Sheet1". This is a legacy parameter, it is recommended you use one of the following: databaseTable, googleWorksheet

# - database\_table [dict::]

- \* schema [string] The database schema name.
- \* table [string] The database table name.
- \* use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- google\_worksheet [dict::]
  - \* **spreadsheet** [string] The spreadsheet document name.
  - \* worksheet [string] The worksheet tab name.

#### advanced\_options [dict::]

- max\_errors : integer
- existing\_table\_rows: string
- diststyle: string

- distkey: string
- sortkey1: string
- sortkey2: string
- column\_delimiter : string
- column\_overrides [dict] Hash used for overriding autodetected names and types, with keys being the index of the column being overridden.
- escaped [boolean] If true, escape quotes with a backslash; otherwise, escape quotes by double-quoting. Defaults to false.
- identity\_column : string
- row\_chunk\_size : integer
- wipe\_destination\_table : boolean
- truncate\_long\_lines : boolean
- invalid\_char\_replacement : string
- verify\_table\_row\_counts : boolean
- partition\_column\_name : string

- partition\_table\_partition\_column\_min\_name : string
- partition\_table\_partition\_column\_max\_name : string
- last\_modified\_column : string
- mysql\_catalog\_matches\_schema : boolean
- chunking\_method [string] The method used to break the data into smaller chunks for transfer. The value can be set to sorted\_by\_identity\_columns or if not set the chunking method will be choosen automatically.
- first row is header: boolean
- export\_action [string] The kind of export action you want to have the export execute. Set to "newsprsht" if you want a new worksheet inside a new spreadsheet. Set to "newwksht" if you want a new worksheet inside an existing spreadsheet. Set to "updatewksht" if you want to overwrite an existing worksheet inside an existing spreadsheet. Set to "appendwksht" if you want to append to the end of an existing worksheet inside an existing spreadsheet.
- sql\_query [string] If you are doing a Google Sheet export, this
  is your SQL query.
- contact\_lists : string
- soql\_query : string

state [string]

created\_at [string/date-time]

# updated\_at [string/date-time] last run [dict::]

- id : integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- started at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

# user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

**time zone** [string] The time zone of this import.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

## **Parameters**

**file ids** [list] The file IDs for the import.

**schema** [string] The destination schema name. This schema must already exist in Redshift.

**table** [string] The destination table name, without the schema prefix. This table must already exist in Redshift.

**remote\_host\_id** [integer] The ID of the destination database host.

**credential\_id** [integer] The ID of the credentials to be used when performing the database import.

**column\_delimiter** [string, optional] The column delimiter for the file. Valid arguments are "comma", "tab", and "pipe". If unspecified, defaults to "comma".

**first\_row\_is\_header** [boolean, optional] A boolean value indicating whether or not the first row is a header row. If unspecified, defaults to false.

**compression** [string, optional] The type of compression. Valid arguments are "gzip", "zip", and "none". If unspecified, defaults to "gzip".

hidden [boolean, optional] The hidden status of the item.

## Returns

id [integer] The ID for the import.

```
schema [string] The destination schema name. This schema must already exist in Redshift.
```

**table** [string] The destination table name, without the schema prefix. This table must already exist in Redshift.

**remote\_host\_id** [integer] The ID of the destination database host.

**state** [string] The state of the run; one of "queued", "running", "succeeded", "failed", or "cancelled".

**started\_at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error returned by the run, if any.

hidden [boolean] The hidden status of the item.

#### post cancel (id)

Cancel a run

#### **Parameters**

id [integer] The ID of the job.

#### Returns

id [integer] The ID of the run.

**state** [string] The state of the run, one of 'queued', 'running' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

post\_files (schema, name, remote\_host\_id, credential\_id, \*, max\_errors='DEFAULT', existing\_table\_rows='DEFAULT', diststyle='DEFAULT', distkey='DEFAULT',
sortkey1='DEFAULT', sortkey2='DEFAULT', column\_delimiter='DEFAULT',
first\_row\_is\_header='DEFAULT', multipart='DEFAULT', escaped='DEFAULT',
hidden='DEFAULT')

Initate an import of a tabular file into the platform

#### **Parameters**

**schema** [string] The schema of the destination table.

name [string] The name of the destination table.

remote\_host\_id [integer] The id of the destination database host.

**credential\_id** [integer] The id of the credentials to be used when performing the database import.

**max\_errors** [integer, optional] The maximum number of rows with errors to remove from the import before failing.

**existing\_table\_rows** [string, optional] The behaviour if a table with the requested name already exists. One of "fail", "truncate", "append", or "drop".Defaults to "fail".

**diststyle** [string, optional] The diststyle to use for the table. One of "even", "all", or "kev".

**distkey** [string, optional] The column to use as the distkey for the table.

**sortkey1** [string, optional] The column to use as the sort key for the table.

sortkey2 [string, optional] The second column in a compound sortkey for the table.

**column\_delimiter** [string, optional] The column delimiter of the file. If column\_delimiter is null or omitted, it will be auto-detected. Valid arguments are "comma", "tab", and "pipe".

**first\_row\_is\_header** [boolean, optional] A boolean value indicating whether or not the first row is a header row. If first\_row\_is\_header is null or omitted, it will be auto-detected.

**multipart** [boolean, optional] If true, the upload URI will require a *multipart/form-data* POST request. Defaults to false.

**escaped** [boolean, optional] If true, escape quotes with a backslash; otherwise, escape quotes by double-quoting. Defaults to false.

**hidden** [boolean, optional] The hidden status of the item.

# Returns

**Parameters** 

id [integer]
source [dict::]

```
id [integer] The id of the import.
upload_uri [string] The URI which may be used to upload a tabular file for import.
You must use this URI to upload the file you wish imported and then inform the Civis API when your upload is complete using the URI given by the runUri field of this response.
run_uri [string] The URI to POST to once the file upload is complete. After uploading the file using the URI given in the uploadUri attribute of the response, POST to
```

this URI to initiate the import of your uploaded file into the platform. **upload\_fields** [dict] If multipart was set to true, these fields should be included in the multipart upload.

```
post_files_runs(id)
      Start a run
            Parameters
                  id [integer] The ID of the import.
            Returns
                  id [integer] The ID of the run.
                  import_id [integer] The ID of the import.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                        'cancelled'.
                  is cancel requested [boolean] True if run cancel requested, else false.
                  started_at [string/time] The time the last run started at.
                  finished_at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
post_runs(id)
      Run an import
            Parameters
                  id [integer] The ID of the import to run.
            Returns
                  run id [integer] The ID of the new run triggered.
post_syncs (id, source, destination, *, advanced_options='DEFAULT')
      Create a sync
```

- path [string] The path of the dataset to sync from; for a database source, schema.tablename. If you are doing a Google Sheet export, this can be blank. This is a legacy parameter, it is recommended you use one of the following: databaseTable, file, googleWorksheet, salesforce, silverpop
- database\_table [dict::]
  - schema [string] The database schema name.
  - table [string] The database table name.
  - use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- file : dict
- google\_worksheet [dict::]
  - **spreadsheet** [string] The spreadsheet document name.
  - worksheet [string] The worksheet tab name.

- salesforce [dict::]
  - **object\_name** [string] The Salesforce object name.
- silverpop [dict::]
  - list\_id [integer] The Silverpop list id.

## destination [dict::]

- path [string] The schema.tablename to sync to. If you are doing a Google Sheet export, this is the spreadsheet and sheet name separated by a period. i.e. if you have a spreadsheet named "MySpreadsheet" and a sheet called "Sheet1" this field would be "MySpreadsheet.Sheet1". This is a legacy parameter, it is recommended you use one of the following: databaseTable, googleWorksheet
- database\_table [dict::]
  - schema [string] The database schema name.
  - **table** [string] The database table name.
  - use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- google\_worksheet [dict::]
  - spreadsheet [string] The spreadsheet document name.
  - **worksheet** [string] The worksheet tab name.

# advanced\_options [dict, optional::]

- max\_errors : integer
- existing\_table\_rows : string
- diststyle : string
- distkey: string
- · sortkey1: string
- sortkey2: string
- column\_delimiter : string
- **column\_overrides** [dict] Hash used for overriding auto-detected names and types, with keys being the index of the column being overridden.
- **escaped** [boolean] If true, escape quotes with a backslash; otherwise, escape quotes by double-quoting. Defaults to false.
- identity\_column : string
- row\_chunk\_size : integer
- wipe\_destination\_table : boolean
- truncate\_long\_lines : boolean
- invalid\_char\_replacement : string
- verify\_table\_row\_counts : boolean
- partition\_column\_name : string
- partition\_schema\_name : string

- partition\_table\_name : string
- partition\_table\_partition\_column\_min\_name : string
- partition\_table\_partition\_column\_max\_name : string
- · last\_modified\_column: string
- mysql catalog matches schema: boolean
- chunking\_method [string] The method used to break the data into smaller chunks for transfer. The value can be set to sorted\_by\_identity\_columns or if not set the chunking method will be choosen automatically.
- first\_row\_is\_header : boolean
- export\_action [string] The kind of export action you want to have the export execute. Set to "newsprsht" if you want a new worksheet inside a new spreadsheet. Set to "newwksht" if you want a new worksheet inside an existing spreadsheet. Set to "updatewksht" if you want to overwrite an existing worksheet inside an existing spreadsheet. Set to "appendwksht" if you want to append to the end of an existing worksheet inside an existing spreadsheet.
- **sql\_query** [string] If you are doing a Google Sheet export, this is your SQL query.
- contact\_lists : string
- soql\_query : string

#### Returns

id [integer]
source [dict::]

- id [integer] The ID of the table or file, if available.
- path [string] The path of the dataset to sync from; for a database source, schema.tablename. If you are doing a Google Sheet export, this can be blank. This is a legacy parameter, it is recommended you use one of the following: databaseTable, file, googleWorksheet, salesforce, silverpop
- database\_table [dict::]
  - schema [string] The database schema name.
  - table [string] The database table name.
  - use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- file [dict::]
  - id [integer] The file id.
- google\_worksheet [dict::]
  - spreadsheet [string] The spreadsheet document name.
  - worksheet [string] The worksheet tab name.
- salesforce [dict::]
  - object name [string] The Salesforce object name.

- silverpop [dict::]
  - **list\_id** [integer] The Silverpop list id.

# destination [dict::]

- path [string] The schema.tablename to sync to. If you are doing a Google Sheet export, this is the spreadsheet and sheet name separated by a period. i.e. if you have a spreadsheet named "MySpreadsheet" and a sheet called "Sheet1" this field would be "MySpreadsheet.Sheet1". This is a legacy parameter, it is recommended you use one of the following: databaseTable, googleWorksheet
- database\_table [dict::]
  - schema [string] The database schema name.
  - table [string] The database table name.
  - use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- google\_worksheet [dict::]
  - spreadsheet [string] The spreadsheet document name.
  - worksheet [string] The worksheet tab name.

# advanced\_options [dict::]

- max\_errors : integer
- existing\_table\_rows : string
- · diststyle: string
- · distkey: string
- sortkey1: string
- sortkey2: string
- column\_delimiter : string
- **column\_overrides** [dict] Hash used for overriding auto-detected names and types, with keys being the index of the column being overridden.
- **escaped** [boolean] If true, escape quotes with a backslash; otherwise, escape quotes by double-quoting. Defaults to false.
- identity\_column : string
- row chunk size: integer
- wipe\_destination\_table : boolean
- truncate\_long\_lines : boolean
- invalid\_char\_replacement : string
- verify\_table\_row\_counts : boolean
- partition\_column\_name : string
- partition\_schema\_name : string
- partition\_table\_name : string
- partition\_table\_partition\_column\_min\_name : string

- partition\_table\_partition\_column\_max\_name : string
- last\_modified\_column : string
- mysql\_catalog\_matches\_schema : boolean
- chunking\_method [string] The method used to break the data into smaller chunks for transfer. The value can be set to sorted\_by\_identity\_columns or if not set the chunking method will be choosen automatically.
- first\_row\_is\_header : boolean
- export\_action [string] The kind of export action you want to have the export execute. Set to "newsprsht" if you want a new worksheet inside a new spreadsheet. Set to "newwksht" if you want a new worksheet inside an existing spreadsheet. Set to "updatewksht" if you want to overwrite an existing worksheet inside an existing spreadsheet. Set to "appendwksht" if you want to append to the end of an existing worksheet inside an existing spreadsheet.
- sql\_query [string] If you are doing a Google Sheet export, this is your SQL query.
- contact\_lists : string
- soql\_query : string

put (id, name, sync\_type, is\_outbound, \*, source='DEFAULT', destination='DEFAULT', schedule='DEFAULT', notifications='DEFAULT', parent\_id='DEFAULT', next\_run\_at='DEFAULT', time\_zone='DEFAULT') Update an import

## **Parameters**

id [integer] The ID for the import.

name [string] The name of the import.

sync\_type [string] The type of sync to perform; one of Dbsync, AutoImport, Silver-popDataImport, SilverpopContactImport, GdocImport, GdocExport, and Salesforce.

is\_outbound [boolean]

source [dict, optional::]

- remote\_host\_id : integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.

destination [dict, optional::]

- remote\_host\_id : integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.

- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

# **notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

parent\_id [integer, optional] Parent id to trigger this import from

**next\_run\_at** [string/time, optional] The time of the next scheduled run.

time zone [string, optional] The time zone of this import.

### Returns

**name** [string] The name of the import.

**sync\_type** [string] The type of sync to perform; one of Dbsync, AutoImport, SilverpopDataImport, SilverpopContactImport, GdocImport, GdocExport, and Salesforce.

# source [dict::]

- remote host id: integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.

• name : string

# destination [dict::]

- remote\_host\_id : integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.

• name : string

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent: defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

parent\_id [integer] Parent id to trigger this import from

id [integer] The ID for the import.

is\_outbound [boolean]

**job\_type** [string] The job type of this import.

syncs [list::] List of syncs. - id: integer - source: dict:

```
- id : integer
   The ID of the table or file, if available.
- path : string
   The path of the dataset to sync from; for a database_
⇒source,
   schema.tablename. If you are doing a Google Sheet_
⇔export, this can
   be blank. This is a legacy parameter, it is.
→recommended you use one
   of the following: databaseTable, file, googleWorksheet,
→ salesforce,
   silverpop
- database_table : dict::
   - schema : string
       The database schema name.
   - table : string
       The database table name.
   - use_without_schema : boolean
```

(continues on next page)

(continued from previous page)

```
If true, the table has no schema. Defaults to...
⇔false.
- file : dict::
    - id : integer
       The file id.
- google_worksheet : dict::
    spreadsheet : string
       The spreadsheet document name.
    - worksheet : string
       The worksheet tab name.
- salesforce : dict::
    - object_name : string
       The Salesforce object name.
- silverpop : dict::
    - list id : integer
        The Silverpop list id.
```

### • destination [dict::]

- path [string] The schema.tablename to sync to. If you are doing a Google Sheet export, this is the spreadsheet and sheet name separated by a period. i.e. if you have a spreadsheet named "MySpreadsheet" and a sheet called "Sheet1" this field would be "MySpreadsheet.Sheet1". This is a legacy parameter, it is recommended you use one of the following: databaseTable, googleWorksheet
- database\_table [dict::]
  - \* schema [string] The database schema name.
  - \* table [string] The database table name.
  - \* **use\_without\_schema** [boolean] If true, the table has no schema. Defaults to false.
- google\_worksheet [dict::]
  - \* spreadsheet [string] The spreadsheet document name.
  - \* worksheet [string] The worksheet tab name.

- mysql\_catalog\_matches\_schema : boolean
- chunking\_method [string] The method used to break the data into smaller chunks for transfer. The value can be set to sorted\_by\_identity\_columns or if not set the chunking method will be choosen automatically.
- first\_row\_is\_header : boolean
- export\_action [string] The kind of export action you want to have the export execute. Set to "newsprsht" if you want a new worksheet inside a new spreadsheet. Set to "newwksht" if you want a new worksheet inside an existing spreadsheet. Set to "updatewksht" if you want to overwrite an existing worksheet inside an existing spreadsheet. Set to "appendwksht" if you want to append to the end of an existing worksheet inside an existing spreadsheet.
- sql\_query [string] If you are doing a Google Sheet export, this is your SQL query.
- contact\_lists : string
- soql\_query : string

state [string]
created\_at [string/date-time]
updated\_at [string/date-time]
last\_run [dict::]

- id: integer
- · state: string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished at** [string/time] The time that the run completed.

• error [string] The error message for this run, if present.

## user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

**time\_zone** [string] The time zone of this import.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

# put\_archive (id, status)

Update the archive status of this object

### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

# Returns

**name** [string] The name of the import.

**sync\_type** [string] The type of sync to perform; one of Dbsync, AutoImport, SilverpopDataImport, SilverpopContactImport, GdocImport, GdocExport, and Salesforce.

# source [dict::]

- remote\_host\_id : integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.
- name : string

# destination [dict::]

- remote\_host\_id : integer
- credential\_id : integer
- additional\_credentials [list] Array that holds additional credentials used for specific imports. For salesforce imports, the first and only element is the client credential id.
- name: string

# schedule [dict::]

• scheduled [boolean] If the item is scheduled.

- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent: defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

parent\_id [integer] Parent id to trigger this import from

id [integer] The ID for the import.

is\_outbound [boolean]

**job\_type** [string] The job type of this import.

syncs [list::] List of syncs. - id : integer - source : dict:

```
- id : integer
   The ID of the table or file, if available.
- path : string
   The path of the dataset to sync from; for a database_
⇔source,
   schema.tablename. If you are doing a Google Sheet_
⇔export, this can
   be blank. This is a legacy parameter, it is.
→recommended you use one
   of the following: databaseTable, file, googleWorksheet,
→ salesforce,
   silverpop
- database_table : dict::
    - schema : string
       The database schema name.

- first row is header: boolean
- export\_action [string] The kind of export action you want to have the export execute. Set to "newsprsht" if you want a new worksheet inside a new spreadsheet. Set to "newwksht" if you want a new worksheet inside an existing spreadsheet. Set to "updatewksht" if you want to overwrite an existing worksheet inside an existing spreadsheet. Set to "appendwksht" if you want to append to the end of an existing worksheet inside an existing spreadsheet.
- sql\_query [string] If you are doing a Google Sheet export, this
  is your SQL query.
- contact\_lists : string
- soql\_query : string

state [string]

created at [string/date-time]

updated\_at [string/date-time]

last\_run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

user [dict::]

```
• id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  running_as [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  next_run_at [string/time] The time of the next scheduled run.
                  time_zone [string] The time zone of this import.
                  hidden [boolean] The hidden status of the item.
                  archived [string] The archival status of the requested item(s).
put_projects (id, project_id)
      Add a JobTypes::Import to a project
            Parameters
                  id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_shares_groups (id, group_ids, permission_level, *, share_email_body='DEFAULT',
                          send shared email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
```

```
- id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
                                                                      share email body='DEFAULT',
put_shares_users (id,
                              user_ids, permission_level,
                        send shared email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
```

- id: integer
- name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

# **Parameters**

id [integer] The ID of the import to fetch.
sync\_id [integer] The ID of the sync to fetch.
source [dict::]

- path [string] The path of the dataset to sync from; for a database source, schema.tablename. If you are doing a Google Sheet export, this can be blank. This is a legacy parameter, it is recommended you use one of the following: databaseTable, file, googleWorksheet, salesforce, silverpop
- database\_table [dict::]
  - schema [string] The database schema name.
  - table [string] The database table name.
  - use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- file: dict
- google\_worksheet [dict::]
  - spreadsheet [string] The spreadsheet document name.
  - worksheet [string] The worksheet tab name.
- salesforce [dict::]
  - **object\_name** [string] The Salesforce object name.
- silverpop [dict::]
  - list\_id [integer] The Silverpop list id.

# destination [dict::]

- path [string] The schema.tablename to sync to. If you are doing a Google Sheet export, this is the spreadsheet and sheet name separated by a period. i.e. if you have a spreadsheet named "MySpreadsheet" and a sheet called "Sheet1" this field would be "MySpreadsheet.Sheet1". This is a legacy parameter, it is recommended you use one of the following: databaseTable, googleWorksheet
- database\_table [dict::]
  - schema [string] The database schema name.
  - table [string] The database table name.
  - use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- google worksheet [dict::]

- **spreadsheet** [string] The spreadsheet document name.
- worksheet [string] The worksheet tab name.

advanced\_options [dict, optional::]

- max\_errors : integer
- existing\_table\_rows : string
- diststyle : string
- distkey: string
- · sortkey1: string
- sortkey2 : string
- column\_delimiter : string
- **column\_overrides** [dict] Hash used for overriding auto-detected names and types, with keys being the index of the column being overridden.
- **escaped** [boolean] If true, escape quotes with a backslash; otherwise, escape quotes by double-quoting. Defaults to false.
- identity\_column : string
- row\_chunk\_size : integer
- wipe\_destination\_table : boolean
- truncate\_long\_lines : boolean
- · invalid\_char\_replacement : string
- verify\_table\_row\_counts : boolean
- partition\_column\_name : string
- partition\_schema\_name : string
- partition\_table\_name : string
- partition\_table\_partition\_column\_min\_name : string
- partition\_table\_partition\_column\_max\_name : string
- last modified column: string
- mysql\_catalog\_matches\_schema : boolean
- chunking\_method [string] The method used to break the data into smaller chunks for transfer. The value can be set to sorted\_by\_identity\_columns or if not set the chunking method will be choosen automatically.
- first\_row\_is\_header : boolean
- export\_action [string] The kind of export action you want to have the export execute. Set to "newsprsht" if you want a new worksheet inside a new spreadsheet. Set to "newwksht" if you want a new worksheet inside an existing spreadsheet. Set to "updatewksht" if you want to overwrite an existing worksheet inside an existing spreadsheet. Set to "appendwksht" if you want to append to the end of an existing worksheet inside an existing spreadsheet.

- **sql\_query** [string] If you are doing a Google Sheet export, this is your SQL query.
- contact\_lists : string
- soql\_query : string

### Returns

id [integer]
source [dict::]

- id [integer] The ID of the table or file, if available.
- path [string] The path of the dataset to sync from; for a database source, schema.tablename. If you are doing a Google Sheet export, this can be blank. This is a legacy parameter, it is recommended you use one of the following: databaseTable, file, googleWorksheet, salesforce, silverpop
- database\_table [dict::]
  - schema [string] The database schema name.
  - table [string] The database table name.
  - use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- file [dict::]
  - id [integer] The file id.
- google\_worksheet [dict::]
  - spreadsheet [string] The spreadsheet document name.
  - worksheet [string] The worksheet tab name.
- salesforce [dict::]
  - **object\_name** [string] The Salesforce object name.
- silverpop [dict::]
  - **list\_id** [integer] The Silverpop list id.

# destination [dict::]

- path [string] The schema.tablename to sync to. If you are doing a Google Sheet export, this is the spreadsheet and sheet name separated by a period. i.e. if you have a spreadsheet named "MySpreadsheet" and a sheet called "Sheet1" this field would be "MySpreadsheet.Sheet1". This is a legacy parameter, it is recommended you use one of the following: databaseTable, googleWorksheet
- database\_table [dict::]
  - schema [string] The database schema name.
  - table [string] The database table name.
  - use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- google\_worksheet [dict::]
  - spreadsheet [string] The spreadsheet document name.

- worksheet [string] The worksheet tab name.

# advanced\_options [dict::]

```
contact_lists : string
```

• soql\_query : string

put\_syncs\_archive (id, sync\_id, \*, status='DEFAULT')

Update the archive status of this sync

## **Parameters**

id [integer] The ID of the import to fetch.

sync id [integer] The ID of the sync to fetch.

**status** [boolean, optional] The desired archived status of the sync.

### Returns

id [integer]
source [dict::]

- id [integer] The ID of the table or file, if available.
- path [string] The path of the dataset to sync from; for a database source, schema.tablename. If you are doing a Google Sheet export, this can be blank. This is a legacy parameter, it is recommended you use one of the following: databaseTable, file, googleWorksheet, salesforce, silverpop
- database\_table [dict::]
  - schema [string] The database schema name.
  - table [string] The database table name.
  - use\_without\_schema [boolean] If true, the table has no schema. Defaults to false.
- file [dict::]
  - id [integer] The file id.
- google\_worksheet [dict::]
  - spreadsheet [string] The spreadsheet document name.
  - worksheet [string] The worksheet tab name.
- salesforce [dict::]
  - **object\_name** [string] The Salesforce object name.
- silverpop [dict::]
  - **list\_id** [integer] The Silverpop list id.

### destination [dict::]

- path [string] The schema.tablename to sync to. If you are doing a Google Sheet export, this is the spreadsheet and sheet name separated by a period. i.e. if you have a spreadsheet named "MySpreadsheet" and a sheet called "Sheet1" this field would be "MySpreadsheet.Sheet1". This is a legacy parameter, it is recommended you use one of the following: databaseTable, googleWorksheet

• sql\_query [string] If you are doing a Google Sheet export, this is your

```
• soql_query : string
Jobs
class Jobs (session_kwargs, return_type='civis')
     Methods
     delete_projects (id, project_id)
           Remove a Job from a project
                 Parameters
                       id [integer] The ID of the resource.
                       project_id [integer] The ID of the project.
                 Returns
                       None Response code 204: success
     delete runs (id, run id)
           Cancel a run
                 Parameters
                       id [integer] The ID of the Job.
                       run_id [integer] The ID of the Run.
                 Returns
                       None Response code 202: success
     delete_shares_groups (id, group_id)
           Revoke the permissions a group has on this object
                 Parameters
                       id [integer] The ID of the resource that is shared.
                       group_id [integer] The ID of the group.
                 Returns
                       None Response code 204: success
     delete_shares_users (id, user_id)
           Revoke the permissions a user has on this object
                 Parameters
                       id [integer] The ID of the resource that is shared.
                       user_id [integer] The ID of the user.
                 Returns
                       None Response code 204: success
     get (id)
           Show basic job info
                 Parameters
                       id [integer] The ID for this job.
                 Returns
                       id [integer]
                       name [string]
                       type [string]

                                                                                  limit='DEFAULT',
       page_num='DEFAULT', order='DEFAULT', order_dir='DEFAULT', iterator='DEFAULT')
      List
            Parameters
```

**state** [string] Whether the job is idle, queued, running, cancelled, or failed.

**state** [string, optional] The job's state. One or more of queued, running, succeeded, failed, and cancelled. Specify multiple values as a comma-separated list (e.g., "A.B").

**type** [string, optional] The job's type. Specify multiple values as a comma-separated list (e.g., "A,B").

**q** [string, optional] Query string to search on the id, name, and job type.

**permission** [string, optional] A permissions string, one of "read", "write", or "manage". Lists only jobs for which the current user has that permission.

**scheduled** [boolean, optional] If the item is scheduled.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**archived** [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

#### Returns

```
id [integer]
name [string]
type [string]
from_template_id [integer]
state [string] Whether the job is idle, queued, running, cancelled, or failed.
created_at [string/date-time]
updated_at [string/date-time]
last_run [dict::]
```

- id: integer
- · state: string
- **created\_at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

archived [string] The archival status of the requested item(s).
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## list children(id)

Show nested tree of children that this job triggers

```
Parameters
                  id [integer] The ID for this job.
            Returns
                  id [integer]
                  name [string]
                  type [string]
                  from template id [integer]
                  state [string]
                  created at [string/date-time]

                             • id: integer
                             • state : string
                             • created_at [string/time] The time that the run was queued.
                             • started_at [string/time] The time that the run started.
                             • finished at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  last_run [dict::]
                             • id: integer
                             • state: string
                             • created at [string/time] The time that the run was queued.
                             • started_at [string/time] The time that the run started.
                             • finished_at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  children [list]
list\_parents(id)
      Show chain of parents as a list that this job triggers from
            Parameters
                  id [integer] The ID for this job.
            Returns
                  id [integer]
                  name [string]
                  type [string]
                  from template id [integer]
                  state [string] Whether the job is idle, queued, running, cancelled, or failed.
                  created at [string/date-time]
                  updated_at [string/date-time]
                  runs [list::] Information about the most recent runs of the job. - id: integer - state:
                         string - created_at : string/time
                               The time that the run was queued.
                             • started_at [string/time] The time that the run started.
                             • finished_at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  last run [dict::]
```

- id: integer
- state: string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

# list\_projects (id, \*, hidden='DEFAULT')

List the projects a Job belongs to

### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

### Returns

id [integer] The ID for this project.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of this project.

description [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto\_share [boolean]
created\_at [string/time]
updated\_at [string/time]
archived [string] The archival status of the requested item(s).

```
list_runs_logs (id, run_id, *, last_id='DEFAULT', limit='DEFAULT')
      Get the logs for a run
           Parameters
                  id [integer] The ID of the job.
                  run_id [integer] The ID of the run.
                  last id [integer, optional] The ID of the last log message received. Log entries with
                        this ID value or lower will be omitted. Logs are sorted by ID if this value is
                        provided, and are otherwise sorted by createdAt.
                  limit [integer, optional] The maximum number of log messages to return. Default of
                        10000.
            Returns
                  id [integer] The ID of the log.
                  created_at [string/date-time] The time the log was created.
                  message [string] The log message.
                  level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.
list\_shares(id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
```

and readers, the number of visible users shared.

ers and readers, the number of visible groups shared. list workflows (id, \*, archived='DEFAULT') List the workflows a job belongs to **Parameters** id [integer] **archived** [string, optional] The archival status of the requested item(s). Returns id [integer] The ID for this workflow. name [string] The name of this workflow. **description** [string] A description of the workflow. valid [boolean] The validity of the workflow definition. **file\_id** [string] The file id for the s3 file containing the workflow configuration. user [dict::] • id [integer] The ID of this user. • name [string] This user's name. • username [string] This user's username. • initials [string] This user's initials. • online [boolean] Whether this user is online. state [string] The state of the workflow. State is "running" if any execution is running, otherwise reflects most recent execution state. schedule [dict::] • scheduled [boolean] If the item is scheduled. • scheduled\_days [list] Day based on numeric value starting at 0 for Sun-• scheduled\_hours [list] Hours of the day it is scheduled on. • scheduled\_minutes [list] Minutes of the day it is scheduled on. • scheduled\_runs\_per\_hour [integer] Alternative to scheduled minutes, number of times to run per hour. **time zone** [string] The time zone of this workflow. **next execution at** [string/time] The time of the next scheduled execution. **archived** [string] The archival status of the requested item(s). created at [string/time] updated\_at [string/time] post runs (id) Run a job **Parameters** id [integer] The ID for this job. Returns id [integer] state [string] **created\_at** [string/time] The time that the run was queued. **started\_at** [string/time] The time that the run started. **finished\_at** [string/time] The time that the run completed. error [string] The error message for this run, if present. post trigger email(id)

6.5. API Client 271

Generate and retrieve trigger email address

```
Parameters
                  id [integer] The ID for this job.
            Returns
                  trigger_email [string] Email address which may be used to trigger this job to run.
put_projects (id, project_id)
      Add a Job to a project
           Parameters
                  id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_shares_groups (id,
                              group_ids, permission_level, *, share_email_body='DEFAULT',
                         send_shared_email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send shared email [boolean, optional] Send email to the recipients of a share.
           Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer

### Media

```
class Media(session_kwargs, return_type='civis')
```

#### **Methods**

delete\_optimizations\_runs(id, run\_id)

Cancel a run

## **Parameters**

id [integer] The ID of the optimization.run\_id [integer] The ID of the run.

**Returns** 

None Response code 202: success

### delete\_optimizations\_shares\_groups (id, group\_id)

Revoke the permissions a group has on this object

### **Parameters**

id [integer] The ID of the resource that is shared.group\_id [integer] The ID of the group.

Returns

None Response code 204: success

## delete optimizations shares users (id, user id)

Revoke the permissions a user has on this object

# **Parameters**

id [integer] The ID of the resource that is shared.user\_id [integer] The ID of the user.

Returns

None Response code 204: success

# ${\tt delete\_ratecards\_shares\_groups}\ (id,\ group\_id)$

Revoke the permissions a group has on this object

### **Parameters**

id [integer] The ID of the resource that is shared.group\_id [integer] The ID of the group.

Returns

None Response code 204: success

## delete ratecards shares users (id, user id)

Revoke the permissions a user has on this object

#### **Parameters**

id [integer] The ID of the resource that is shared.user\_id [integer] The ID of the user.

# Returns

None Response code 204: success

# delete\_spot\_orders\_shares\_groups (id, group\_id)

Revoke the permissions a group has on this object

# **Parameters**

id [integer] The ID of the resource that is shared.group\_id [integer] The ID of the group.

# Returns

None Response code 204: success

# delete\_spot\_orders\_shares\_users (id, user\_id)

Revoke the permissions a user has on this object

#### **Parameters**

id [integer] The ID of the resource that is shared.

**user\_id** [integer] The ID of the user.

## Returns

None Response code 204: success

#### get optimizations (id)

Show a single optimization

### **Parameters**

id [integer] The optimization ID.

### **Returns**

id [integer] The optimization ID.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of the optimization.

created\_at [string/time]

updated\_at [string/time]

**finished at** [string/date-time] The end time of the last run.

**state** [string] The state of the last run.

last\_run\_id [integer] The ID of the last run.

spot\_order\_id [integer] The ID for the spot order produced by the optimization.

**archived** [string] The archival status of the requested item(s).

**report\_link** [string] A link to the visual report for the optimization.

**spot\_order\_link** [string] A link to the json version of the spot order.

file\_links [list] Links to the csv and xml versions of the spot order.

runs [list::] The runs of the optimization. - market\_id : integer

The market ID.

- start\_date [string/date] The start date for the media run.
- end date [string/date] The end date for the media run.
- **force\_cpm** [boolean] Whether to force optimization to use CPM data even if partition data is available.
- reach\_alpha [number/float] A tuning parameter used to adjust RF.
- syscodes [list] The syscodes for the media run.
- rate\_cards [list] The ratecards for the media run.
- constraints [list::] The constraints for the media run. targets : list

The targets to constrain.

- **budget** [number/float] The maximum budget for these targets.
- frequency [number/float] The maximum frequency for these targets.

```
exclude programs [boolean] If Civis Media Optimizer should exclude the programs
                        in the programs parameter. If this value is set to false, it will make the optimiza-
                        tion limit itself to the programs supplied through the programs parameter. An
                        error will be thrown if programs is not also set.
                  exclude networks [boolean] If Civis Media Optimizer should exclude the networks
                        in the networks parameter. If this value is set to false, it will make the optimiza-
                        tion limit itself to the networks supplied through the networks.An error will be
                        thrown if networks is not also set.
                  time slot percentages [dict] The maximum amount of the budget spent on that par-
                        ticular day of the week, daypart, or specific time slot for broadcast and cable.
get_optimizations_runs(id, run_id)
      Check status of a run
            Parameters
                  id [integer] The ID of the optimization.
                  run id [integer] The ID of the run.
                  id [integer] The ID of the run.
                  optimization_id [integer] The ID of the optimization.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                         'cancelled'.
                  is cancel requested [boolean] True if run cancel requested, else false.
                  started at [string/time] The time the last run started at.
                  finished_at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
get_ratecards (id)
      Get a Ratecard
            Parameters
                  id [integer]
            Returns
                  id [integer] The ratecard ID.
                  filename [string] Name of the ratecard file.
                  start on [string/date] First day to which the ratecard applies.
                  end_on [string/date] Last day to which the ratecard applies.
                  dma number [integer] Number of the DMA associated with the ratecard.
                  archived [string] The archival status of the requested item(s).
{\tt get\_spot\_orders}\ (id)
      Show a single spot order
            Parameters
                  id [integer] The ID for the spot order.
            Returns
                  id [integer] The ID for the spot order.
                  archived [string] The archival status of the requested item(s).
                  csv_s3_uri [string] S3 URI for the spot order CSV file.
                  json_s3_uri [string] S3 URI for the spot order JSON file.
                  xml_archive_s3_uri [string] S3 URI for the spot order XML archive.
                  last_transform_job_id [integer] ID of the spot order transformation job.
list dmas(*, name='DEFAULT', number='DEFAULT')
      List all Designated Market Areas
```

programs [list] An array of programs that the Civis Media Optimizer either exclude or limit to. An error will be thrown if exclude\_programs is not also set.
 networks [list] An array of networks that the Civis Media Optimizer either exclude or limit to. An error will be thrown if exclude\_networks is not also set.

## **Parameters**

name [string, optional] If specified, will be used to filter the DMAs returned. Substring matching is supported with "%" and "\*" wildcards (e.g., "name=%region%" will return both "region1" and "my region").

**number** [integer, optional] If specified, will be used to filter the DMAS by number.

## Returns

name [string] Name for the DMA region.

**number** [integer] Identifier number for a DMA.

list\_optimizations (\*, archived='DEFAULT', limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')

List all optimizations

#### **Parameters**

**archived** [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to created\_at. Must be one of: created\_at, author, name.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The optimization ID.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- **initials** [string] This user's initials.
- **online** [boolean] Whether this user is online.

name [string] The name of the optimization.

created\_at [string/time]

updated\_at [string/time]

finished\_at [string/date-time] The end time of the last run.

**state** [string] The state of the last run.

**last run id** [integer] The ID of the last run.

 $spot\_order\_id$  [integer] The ID for the spot order produced by the optimization.

**archived** [string] The archival status of the requested item(s).

list\_optimizations\_runs (id, \*, limit='DEFAULT', page\_num='DEFAULT', order\_'DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')
List runs for the given optimization

#### **Parameters**

id [integer] The ID of the optimization.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

## Returns

id [integer] The ID of the run.

**optimization id** [integer] The ID of the optimization.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

**started at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

# list\_optimizations\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')

Get the logs for a run

# **Parameters**

id [integer] The ID of the optimization.

run\_id [integer] The ID of the run.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

#### Returns

id [integer] The ID of the log.

created\_at [string/date-time] The time the log was created.

message [string] The log message.

level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

# list\_optimizations\_shares (id)

List users and groups permissioned on this object

### **Parameters**

id [integer] The ID of the resource that is shared.

### Returns

readers [dict::]

- users [list::]
  - id: integer
  - name : string
- groups [list::]
  - id: integer
  - name: string

# writers [dict::]

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id: integer

```
- name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     name : string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
list_ratecards (*, archived='DEFAULT', filename='DEFAULT', dma_number='DEFAULT')
      List all ratecards
            Parameters
                  archived [string, optional] The archival status of the requested item(s).
                  filename [string, optional] If specified, will be used to filter the ratecards returned.
                        Substring matching is supported with "%" and "*" wildcards (e.g., "file-
                        name=%ratecard%" will return both "ratecard 1" and "my ratecard").
                  dma number [integer, optional] If specified, will be used to filter the ratecards by
                        DMA.
            Returns
                  id [integer] The ratecard ID.
                  filename [string] Name of the ratecard file.
                  start_on [string/date] First day to which the ratecard applies.
                  end on [string/date] Last day to which the ratecard applies.
                  dma_number [integer] Number of the DMA associated with the ratecard.
                  archived [string] The archival status of the requested item(s).
list_ratecards_shares (id)
      List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name : string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]

                                     - name: string
                            • groups [list::]
```

```
- id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
list_spot_orders (*, id='DEFAULT', archived='DEFAULT')
     List all spot orders
            Parameters
                  id [integer, optional] The ID for the spot order.
                  archived [string, optional] The archival status of the requested item(s).
            Returns
                  id [integer] The ID for the spot order.
                  archived [string] The archival status of the requested item(s).
list_spot_orders_shares (id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string

- name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

list\_targets (\*, name='DEFAULT', identifier='DEFAULT', data\_source='DEFAULT')
List all Media Targets

## **Parameters**

**name** [string, optional] The name of the target.

identifier [string, optional] A unique identifier for this target.

data\_source [string, optional] The source of viewership data for this target.

#### Returns

**name** [string] The name of the target.

identifier [string] A unique identifier for this target.

data\_source [string] The source of viewership data for this target.

Edit an existing optimization

#### **Parameters**

id [integer] The optimization ID.

**name** [string, optional] The name of the optimization.

runs [list, optional::] The runs of the optimization. - market\_id : integer

The market ID.

- start\_date [string/date] The start date for the media run.
- end\_date [string/date] The end date for the media run.
- **force\_cpm** [boolean] Whether to force optimization to use CPM data even if partition data is available.
- reach alpha [number/float] A tuning parameter used to adjust RF.
- syscodes [list] The syscodes for the media run.
- rate\_cards [list] The ratecards for the media run.
- constraints [list::] The constraints for the media run. targets : list

The targets to constrain.

- budget [number/float] The maximum budget for these targets.
- frequency [number/float] The maximum frequency for these targets.

**programs** [list, optional] An array of programs that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_programs is not also set. **networks** [list, optional] An array of networks that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_networks is not also set.

- **exclude\_programs** [boolean, optional] If Civis Media Optimizer should exclude the programs in the programs parameter. If this value is set to false, it will make the optimization limit itself to the programs supplied through the programs parameter. An error will be thrown if programs is not also set.
- exclude\_networks [boolean, optional] If Civis Media Optimizer should exclude the networks in the networks parameter. If this value is set to false, it will make the optimization limit itself to the networks supplied through the networks. An error will be thrown if networks is not also set.
- **time\_slot\_percentages** [dict, optional] The maximum amount of the budget spent on that particular day of the week, daypart, or specific time slot for broadcast and cable.

### Returns

id [integer] The optimization ID.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of the optimization.

created\_at [string/time]

updated at [string/time]

**finished\_at** [string/date-time] The end time of the last run.

**state** [string] The state of the last run.

last\_run\_id [integer] The ID of the last run.

**spot\_order\_id** [integer] The ID for the spot order produced by the optimization.

**archived** [string] The archival status of the requested item(s).

**report\_link** [string] A link to the visual report for the optimization.

**spot order link** [string] A link to the ison version of the spot order.

**file\_links** [list] Links to the csv and xml versions of the spot order.

runs [list::] The runs of the optimization. - market\_id : integer

The market ID.

- start date [string/date] The start date for the media run.
- end\_date [string/date] The end date for the media run.
- **force\_cpm** [boolean] Whether to force optimization to use CPM data even if partition data is available.
- reach\_alpha [number/float] A tuning parameter used to adjust RF.
- syscodes [list] The syscodes for the media run.
- rate\_cards [list] The ratecards for the media run.
- constraints [list::] The constraints for the media run. targets : list

The targets to constrain.

- **budget** [number/float] The maximum budget for these targets.
- frequency [number/float] The maximum frequency for these targets.

**programs** [list] An array of programs that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_programs is not also set.

**networks** [list] An array of networks that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_networks is not also set.

**exclude\_programs** [boolean] If Civis Media Optimizer should exclude the programs in the programs parameter. If this value is set to false, it will make the optimization limit itself to the programs supplied through the programs parameter. An error will be thrown if programs is not also set.

**exclude\_networks** [boolean] If Civis Media Optimizer should exclude the networks in the networks parameter. If this value is set to false, it will make the optimization limit itself to the networks supplied through the networks. An error will be thrown if networks is not also set.

**time\_slot\_percentages** [dict] The maximum amount of the budget spent on that particular day of the week, daypart, or specific time slot for broadcast and cable.

Update some attributes of this Ratecard

### **Parameters**

id [integer] The ratecard ID.

filename [string, optional] Name of the ratecard file.

**start on** [string/date, optional] First day to which the ratecard applies.

end\_on [string/date, optional] Last day to which the ratecard applies.

dma\_number [integer, optional] Number of the DMA associated with the ratecard.

### Returns

id [integer] The ratecard ID.

**filename** [string] Name of the ratecard file.

**start\_on** [string/date] First day to which the ratecard applies.

end\_on [string/date] Last day to which the ratecard applies.

**dma\_number** [integer] Number of the DMA associated with the ratecard.

**archived** [string] The archival status of the requested item(s).

Create a new optimization

## **Parameters**

**runs** [list::] The runs of the optimization. - market\_id: integer

The market ID.

- start date [string/date] The start date for the media run.
- end date [string/date] The end date for the media run.
- **force\_cpm** [boolean] Whether to force optimization to use CPM data even if partition data is available.
- reach\_alpha [number/float] A tuning parameter used to adjust RF.
- syscodes [list] The syscodes for the media run.
- rate\_cards [list] The ratecards for the media run.
- constraints [list::] The constraints for the media run. targets : list

The targets to constrain.

- **budget** [number/float] The maximum budget for these targets.

frequency [number/float] The maximum frequency for these targets.

**name** [string, optional] The name of the optimization.

**programs** [list, optional] An array of programs that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_programs is not also set.

**networks** [list, optional] An array of networks that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude networks is not also set.

**exclude\_programs** [boolean, optional] If Civis Media Optimizer should exclude the programs in the programs parameter. If this value is set to false, it will make the optimization limit itself to the programs supplied through the programs parameter. An error will be thrown if programs is not also set.

**exclude\_networks** [boolean, optional] If Civis Media Optimizer should exclude the networks in the networks parameter. If this value is set to false, it will make the optimization limit itself to the networks supplied through the networks. An error will be thrown if networks is not also set.

**time\_slot\_percentages** [dict, optional] The maximum amount of the budget spent on that particular day of the week, daypart, or specific time slot for broadcast and cable.

#### Returns

id [integer] The optimization ID.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of the optimization.

created\_at [string/time]

updated\_at [string/time]

**finished\_at** [string/date-time] The end time of the last run.

**state** [string] The state of the last run.

last\_run\_id [integer] The ID of the last run.

**spot\_order\_id** [integer] The ID for the spot order produced by the optimization.

**archived** [string] The archival status of the requested item(s).

**report\_link** [string] A link to the visual report for the optimization.

**spot order link** [string] A link to the json version of the spot order.

file\_links [list] Links to the csv and xml versions of the spot order.

runs [list::] The runs of the optimization. - market id: integer

The market ID.

- start\_date [string/date] The start date for the media run.
- end\_date [string/date] The end date for the media run.
- **force\_cpm** [boolean] Whether to force optimization to use CPM data even if partition data is available.
- reach\_alpha [number/float] A tuning parameter used to adjust RF.
- syscodes [list] The syscodes for the media run.
- rate cards [list] The ratecards for the media run.

- constraints [list::] The constraints for the media run. targets : list

  The targets to constrain.
  - **budget** [number/float] The maximum budget for these targets.
  - frequency [number/float] The maximum frequency for these targets.

**programs** [list] An array of programs that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_programs is not also set.

**networks** [list] An array of networks that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_networks is not also set.

**exclude\_programs** [boolean] If Civis Media Optimizer should exclude the programs in the programs parameter. If this value is set to false, it will make the optimization limit itself to the programs supplied through the programs parameter. An error will be thrown if programs is not also set.

**exclude\_networks** [boolean] If Civis Media Optimizer should exclude the networks in the networks parameter. If this value is set to false, it will make the optimization limit itself to the networks supplied through the networks. An error will be thrown if networks is not also set.

**time\_slot\_percentages** [dict] The maximum amount of the budget spent on that particular day of the week, daypart, or specific time slot for broadcast and cable.

# post\_optimizations\_clone (id)

Clone an existing optimization

### **Parameters**

id [integer] The optimization ID.

#### Returns

id [integer] The optimization ID.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of the optimization.

created at [string/time]

updated at [string/time]

**finished at** [string/date-time] The end time of the last run.

**state** [string] The state of the last run.

**last\_run\_id** [integer] The ID of the last run.

**spot\_order\_id** [integer] The ID for the spot order produced by the optimization.

**archived** [string] The archival status of the requested item(s).

**report\_link** [string] A link to the visual report for the optimization.

**spot\_order\_link** [string] A link to the json version of the spot order.

file\_links [list] Links to the csv and xml versions of the spot order.

**runs** [list::] The runs of the optimization. - market\_id: integer

The market ID.

- start\_date [string/date] The start date for the media run.
- end date [string/date] The end date for the media run.

- **force\_cpm** [boolean] Whether to force optimization to use CPM data even if partition data is available.
- reach\_alpha [number/float] A tuning parameter used to adjust RF.
- syscodes [list] The syscodes for the media run.
- rate\_cards [list] The ratecards for the media run.
- constraints [list::] The constraints for the media run. targets : list

The targets to constrain.

- **budget** [number/float] The maximum budget for these targets.
- frequency [number/float] The maximum frequency for these targets.

**programs** [list] An array of programs that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_programs is not also set.

**networks** [list] An array of networks that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude networks is not also set.

**exclude\_programs** [boolean] If Civis Media Optimizer should exclude the programs in the programs parameter. If this value is set to false, it will make the optimization limit itself to the programs supplied through the programs parameter. An error will be thrown if programs is not also set.

**exclude\_networks** [boolean] If Civis Media Optimizer should exclude the networks in the networks parameter. If this value is set to false, it will make the optimization limit itself to the networks supplied through the networks. An error will be thrown if networks is not also set.

**time\_slot\_percentages** [dict] The maximum amount of the budget spent on that particular day of the week, daypart, or specific time slot for broadcast and cable.

```
post_optimizations_runs (id)
```

Start a run

### **Parameters**

id [integer] The ID of the optimization.

## Returns

id [integer] The ID of the run.

optimization\_id [integer] The ID of the optimization.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is cancel requested [boolean] True if run cancel requested, else false.

started\_at [string/time] The time the last run started at.

**finished at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

# post\_ratecards (filename, start\_on, end\_on, dma\_number)

Create a Ratecard

#### **Parameters**

**filename** [string] Name of the ratecard file.

start\_on [string/date] First day to which the ratecard applies.

**end\_on** [string/date] Last day to which the ratecard applies.

dma\_number [integer] Number of the DMA associated with the ratecard.

# Returns

**id** [integer] The ratecard ID.

**filename** [string] Name of the ratecard file.

**start on** [string/date] First day to which the ratecard applies.

```
dma number [integer] Number of the DMA associated with the ratecard.
                  archived [string] The archival status of the requested item(s).
post_spot_orders (*, body='DEFAULT')
      Create a spot order
            Parameters
                  body [string, optional] CSV body of a spot order.
            Returns
                  id [integer] The ID for the spot order.
                  archived [string] The archival status of the requested item(s).
                  csv_s3_uri [string] S3 URI for the spot order CSV file.
                  ison s3 uri [string] S3 URI for the spot order JSON file.
                  xml_archive_s3_uri [string] S3 URI for the spot order XML archive.
                  last_transform_job_id [integer] ID of the spot order transformation job.
put_optimizations_archive (id, status)
      Update the archive status of this object
            Parameters
                  id [integer] The ID of the object.
                  status [boolean] The desired archived status of the object.
            Returns
                  id [integer] The optimization ID.
                  author [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  name [string] The name of the optimization.
                  created_at [string/time]
                  updated_at [string/time]
                  finished_at [string/date-time] The end time of the last run.
                  state [string] The state of the last run.
                  last run id [integer] The ID of the last run.
                  spot order id [integer] The ID for the spot order produced by the optimization.
                  archived [string] The archival status of the requested item(s).
                  report link [string] A link to the visual report for the optimization.
                  spot order link [string] A link to the json version of the spot order.
                  file_links [list] Links to the csv and xml versions of the spot order.
                  runs [list::] The runs of the optimization. - market id: integer
                              The market ID.
                            • start_date [string/date] The start date for the media run.
                            • end_date [string/date] The end date for the media run.
                            • force_cpm [boolean] Whether to force optimization to use CPM data
```

end on [string/date] Last day to which the ratecard applies.

6.5. API Client 287

even if partition data is available.

• syscodes [list] The syscodes for the media run.

• reach\_alpha [number/float] A tuning parameter used to adjust RF.

- rate cards [list] The ratecards for the media run.
- constraints [list::] The constraints for the media run. targets : list

The targets to constrain.

- **budget** [number/float] The maximum budget for these targets.
- frequency [number/float] The maximum frequency for these targets.

**programs** [list] An array of programs that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_programs is not also set.

**networks** [list] An array of networks that the Civis Media Optimizer either exclude or limit to.An error will be thrown if exclude\_networks is not also set.

**exclude\_programs** [boolean] If Civis Media Optimizer should exclude the programs in the programs parameter. If this value is set to false, it will make the optimization limit itself to the programs supplied through the programs parameter. An error will be thrown if programs is not also set.

exclude\_networks [boolean] If Civis Media Optimizer should exclude the networks in the networks parameter. If this value is set to false, it will make the optimization limit itself to the networks supplied through the networks. An error will be thrown if networks is not also set.

**time\_slot\_percentages** [dict] The maximum amount of the budget spent on that particular day of the week, daypart, or specific time slot for broadcast and cable.

```
put_optimizations_shares_groups (id,
                                                             group_ids,
                                                                                    permission level,
                                                                     share email body='DEFAULT',
                                              send_shared_email='DEFAULT')
     Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name : string
                            • groups [list::]
                                     - id: integer
                                     - name : string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
```

                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
```

```
total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put ratecards (id, filename, start on, end on, dma number)
      Replace all attributes of this Ratecard
            Parameters
                  id [integer] The ratecard ID.
                  filename [string] Name of the ratecard file.
                  start_on [string/date] First day to which the ratecard applies.
                  end on [string/date] Last day to which the ratecard applies.
                  dma_number [integer] Number of the DMA associated with the ratecard.
            Returns
                  id [integer] The ratecard ID.
                  filename [string] Name of the ratecard file.
                  start_on [string/date] First day to which the ratecard applies.
                  end on [string/date] Last day to which the ratecard applies.
                  dma number [integer] Number of the DMA associated with the ratecard.
                  archived [string] The archival status of the requested item(s).
put_ratecards_archive (id, status)
      Update the archive status of this object
            Parameters
                  id [integer] The ID of the object.
                  status [boolean] The desired archived status of the object.
            Returns
                  id [integer] The ratecard ID.
                  filename [string] Name of the ratecard file.
                  start_on [string/date] First day to which the ratecard applies.
                  end_on [string/date] Last day to which the ratecard applies.
                  dma_number [integer] Number of the DMA associated with the ratecard.
                  archived [string] The archival status of the requested item(s).
put_ratecards_shares_groups (id,
                                                                                     permission_level,
                                                           group_ids,
                                                                      share email body='DEFAULT',
                                        send shared email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send shared email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     name : string

                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put_spot_orders (id, *, body='DEFAULT')
      Edit the specified spot order
            Parameters
                  id [integer] The ID for the spot order.
                  body [string, optional] CSV body of a spot order.
            Returns
                  id [integer] The ID for the spot order.
                  archived [string] The archival status of the requested item(s).
                  csv_s3_uri [string] S3 URI for the spot order CSV file.
                  json s3 uri [string] S3 URI for the spot order JSON file.
                  xml_archive_s3_uri [string] S3 URI for the spot order XML archive.
                  last_transform_job_id [integer] ID of the spot order transformation job.
put_spot_orders_archive (id, status)
      Update the archive status of this object
            Parameters
                  id [integer] The ID of the object.
                  status [boolean] The desired archived status of the object.
            Returns
                  id [integer] The ID for the spot order.
                  archived [string] The archival status of the requested item(s).
                  csv s3 uri [string] S3 URI for the spot order CSV file.
                  json_s3_uri [string] S3 URI for the spot order JSON file.
                  xml archive s3 uri [string] S3 URI for the spot order XML archive.
                  last_transform_job_id [integer] ID of the spot order transformation job.
                                                                                    permission level,
put spot orders shares groups (id,
                                                            group_ids,
                                                                      share email body='DEFAULT',
                                           send_shared_email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send shared email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]

                       total_user_shares [integer] For owners, the number of total users shared. For writers
                             and readers, the number of visible users shared.
                       total_group_shares [integer] For owners, the number of total groups shared. For writ-
                             ers and readers, the number of visible groups shared.
class Models (session_kwargs, return_type='civis')
     delete_builds (id, build_id)
           Cancel a build
                 Parameters
                       id [integer] The ID of the model.
                       build_id [integer] The ID of the build.
                  Returns
                       None Response code 202: success
     delete_projects (id, project_id)
           Remove a models from a project
                 Parameters
                       id [integer] The ID of the resource.
                       project_id [integer] The ID of the project.
                  Returns
                       None Response code 204: success
     delete_shares_groups (id, group_id)
           Revoke the permissions a group has on this object
                 Parameters
                       id [integer] The ID of the resource that is shared.
                       group_id [integer] The ID of the group.
                  Returns
```

Models

**Methods** 

None Response code 204: success

## delete\_shares\_users (id, user\_id)

Revoke the permissions a user has on this object

# **Parameters**

id [integer] The ID of the resource that is shared.

user id [integer] The ID of the user.

#### Returns

None Response code 204: success

### get (id)

Retrieve model configuration

### **Parameters**

id [integer] The ID of the model.

#### Returns

id [integer] The ID of the model.

**table\_name** [string] The qualified name of the table containing the training set from which to build the model.

**database\_id** [integer] The ID of the database holding the training set table used to build the model.

**credential\_id** [integer] The ID of the credential used to read the target table. Defaults to the user's default credential.

**model\_name** [string] The name of the model.

**description** [string] A description of the model.

**interaction terms** [boolean] Whether to search for interaction terms.

**box\_cox\_transformation** [boolean] Whether to transform data so that it assumes a normal distribution. Valid only with continuous models.

model\_type\_id [integer] The ID of the model's type.

primary\_key [string] The unique ID (primary key) of the training dataset.

dependent\_variable [string] The dependent variable of the training dataset.

**dependent\_variable\_order** [list] The order of dependent variables, especially useful for Ordinal Modeling.

**excluded\_columns** [list] A list of columns which will be considered ineligible to be independent variables.

**limiting\_sql** [string] A custom SQL WHERE clause used to filter the rows used to build the model. (e.g., "id > 105").

active\_build\_id [integer] The ID of the current active build, the build used to score
predictions.

**cross\_validation\_parameters** [dict] Cross validation parameter grid for tree methods, e.g. {"n\_estimators": [100, 200, 500], "learning\_rate": [0.01, 0.1], "max\_depth": [2, 3]}.

number\_of\_folds [integer] Number of folds for cross validation. Default value is 5.
notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- success email reply to [string] Address for replies to success emails;

defaults to the author of the job.

- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] The ID of the parent job that will trigger this model.
running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**time\_zone** [string] The time zone of this model.

last\_run [dict::]

- id: integer
- state : string
- **created\_at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/date-time] The time the model was created.

updated\_at [string/date-time] The time the model was updated.

current\_build\_state [string] The status of the current model build. One of "succeeded", "failed", "queued", or "running," or "idle", if no build has been attempted.

current\_build\_exception [string] Exception message, if applicable, of the current model build.

**builds** [list::] A list of trained models available for making predictions. - id : integer

The ID of the model build.

- name [string] The name of the model build.
- created\_at [string] The time the model build was created.
- **description** [string] A description of the model build.
- root\_mean\_squared\_error [number/float] A key metric for continuous models. Nil for other model types.
- r\_squared\_error [number/float] A key metric for continuous models.

  Nil for other model types.
- roc\_auc [number/float] A key metric for binary, multinomial, and ordinal models. Nil for other model types.

**predictions** [list::] The tables upon which the model will be applied. - id: integer The ID of the model to which to apply the prediction.

- **table\_name** [string] The qualified name of the table on which to apply the predictive model.
- **primary\_key** [list] The primary key or composite keys of the table being predicted.
- **limiting\_sql** [string] A SQL WHERE clause used to scope the rows to be predicted.
- **output\_table** [string] The qualified name of the table to be created which will contain the model's predictions.
- schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - scheduled\_runs\_per\_hour [integer] Alternative to scheduled minutes, number of times to run per hour.
- **state** [string] The status of the prediction. One of: "succeeded", "failed", "queued", or "running," or "idle", if no build has been attempted.

**last\_output\_location** [string] The output JSON for the last build. **archived** [string] The archival status of the requested item(s).

**Parameters** 

id [integer] The ID of the model.

**build\_id** [integer] The ID of the build.

#### Returns

id [integer] The ID of the model build.

**state** [string] The state of the model build.one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**error** [string] The error, if any, returned by the build.

**name** [string] The name of the model build.

**created at** [string] The time the model build was created.

**description** [string] A description of the model build.

root\_mean\_squared\_error [number/float] A key metric for continuous models. Nil for other model types.

r\_squared\_error [number/float] A key metric for continuous models. Nil for other model types.

roc\_auc [number/float] A key metric for binary, multinomial, and ordinal models. Nil for other model types.

**transformation\_metadata** [string] A string representing the full JSON output of the metadata for transformation of column names

**output** [string] A string representing the JSON output for the specified build. Only present when smaller than 10KB in size.

**output\_location** [string] A URL representing the location of the full JSON output for the specified build. The URL link will be valid for 5 minutes.

list(\*, model\_name='DEFAULT', training\_table\_name='DEFAULT', dependent\_variable='DEFAULT', author='DEFAULT', status='DEFAULT', hidden='DEFAULT',
 archived='DEFAULT', limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', or der\_dir='DEFAULT', iterator='DEFAULT')
List

### **Parameters**

model\_name [string, optional] If specified, will be used to filter the models returned. Substring matching is supported. (e.g., "modelName=model" will return both "model1" and "my model").

**training\_table\_name** [string, optional] If specified, will be used to filter the models returned by the training dataset table name. Substring matching is supported. (e.g., "trainingTableName=table" will return both "table1" and "my\_table").

**dependent\_variable** [string, optional] If specified, will be used to filter the models returned by the dependent variable column name. Substring matching is supported. (e.g., "dependent Variable=predictor" will return both "predictor" and "my predictor").

**author** [string, optional] If specified, return models from this author. It accepts a comma-separated list of author ids.

**status** [string, optional] If specified, returns models with one of these statuses. It accepts a comma-separated list, possible values are 'running', 'failed', 'succeeded', 'idle', 'scheduled'.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

archived [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

page\_num [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at, last\_run.updated\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True,

limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The ID of the model.

**table\_name** [string] The qualified name of the table containing the training set from which to build the model.

**database\_id** [integer] The ID of the database holding the training set table used to build the model.

credential\_id [integer] The ID of the credential used to read the target table. Defaults to the user's default credential.

**model\_name** [string] The name of the model.

**description** [string] A description of the model.

interaction\_terms [boolean] Whether to search for interaction terms.

**box\_cox\_transformation** [boolean] Whether to transform data so that it assumes a normal distribution. Valid only with continuous models.

model\_type\_id [integer] The ID of the model's type.

primary\_key [string] The unique ID (primary key) of the training dataset.

dependent\_variable [string] The dependent variable of the training dataset.

**dependent\_variable\_order** [list] The order of dependent variables, especially useful for Ordinal Modeling.

**excluded\_columns** [list] A list of columns which will be considered ineligible to be independent variables.

**limiting\_sql** [string] A custom SQL WHERE clause used to filter the rows used to build the model. (e.g., "id > 105").

**cross\_validation\_parameters** [dict] Cross validation parameter grid for tree methods, e.g. {"n\_estimators": [100, 200, 500], "learning\_rate": [0.01, 0.1], "max depth": [2, 3]}.

number\_of\_folds [integer] Number of folds for cross validation. Default value is 5.
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] The ID of the parent job that will trigger this model.

**time zone** [string] The time zone of this model.

last run [dict::]

- id: integer
- state : string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.

- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**created at** [string/date-time] The time the model was created.

updated\_at [string/date-time] The time the model was updated.

current\_build\_state [string] The status of the current model build. One of "succeeded", "failed", "queued", or "running," or "idle", if no build has been attempted.

current\_build\_exception [string] Exception message, if applicable, of the current model build.

builds [list::] A list of trained models available for making predictions. - id: integer

The ID of the model build.

- name [string] The name of the model build.
- **created\_at** [string] The time the model build was created.
- **description** [string] A description of the model build.
- root\_mean\_squared\_error [number/float] A key metric for continuous models. Nil for other model types.
- r\_squared\_error [number/float] A key metric for continuous models.

  Nil for other model types.
- **roc\_auc** [number/float] A key metric for binary, multinomial, and ordinal models. Nil for other model types.

predictions [list::] The tables upon which the model will be applied. - id: integer

The ID of the model to which to apply the prediction.

- **table\_name** [string] The qualified name of the table on which to apply the predictive model.
- **primary\_key** [list] The primary key or composite keys of the table being predicted.
- **limiting\_sql** [string] A SQL WHERE clause used to scope the rows to be predicted.
- **output\_table** [string] The qualified name of the table to be created which will contain the model's predictions.
- **state** [string] The status of the prediction. One of: "succeeded", "failed", "queued", or "running," or "idle", if no build has been attempted.

**last\_output\_location** [string] The output JSON for the last build. **archived** [string] The archival status of the requested item(s).

list\_builds (id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order='DEFAULT', iterator='DEFAULT')

List builds for the given model

### **Parameters**

id [integer] The ID of the model.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

page\_num [integer, optional] Page number of the results to return. Defaults to the first page, 1. **order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The ID of the model build.

**state** [string] The state of the model build.one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**error** [string] The error, if any, returned by the build.

**name** [string] The name of the model build.

created\_at [string] The time the model build was created.

description [string] A description of the model build.

root\_mean\_squared\_error [number/float] A key metric for continuous models. Nil for other model types.

r\_squared\_error [number/float] A key metric for continuous models. Nil for other model types.

**roc\_auc** [number/float] A key metric for binary, multinomial, and ordinal models. Nil for other model types.

**transformation\_metadata** [string] A string representing the full JSON output of the metadata for transformation of column names

**output** [string] A string representing the JSON output for the specified build. Only present when smaller than 10KB in size.

**output\_location** [string] A URL representing the location of the full JSON output for the specified build. The URL link will be valid for 5 minutes.

list\_builds\_logs (id, build\_id, \*, last\_id='DEFAULT', limit='DEFAULT')

Get the logs for a build

#### **Parameters**

id [integer] The ID of the model.

**build\_id** [integer] The ID of the build.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

#### Returns

id [integer] The ID of the log.

**created at** [string/date-time] The time the log was created.

message [string] The log message.

**level** [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

# list\_projects (id, \*, hidden='DEFAULT')

List the projects a models belongs to

# **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

# Returns

id [integer] The ID for this project.
author [dict::]

• id [integer] The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

name [string] The name of this project.

**description** [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto\_share [boolean]

created\_at [string/time]

updated\_at [string/time]

**archived** [string] The archival status of the requested item(s).

### list schedules (id)

Show the model build schedule

#### **Parameters**

id [integer] The ID of the model associated with this schedule.

### **Returns**

id [integer] The ID of the model associated with this schedule.
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

# list\_shares (id)

List users and groups permissioned on this object

## **Parameters**

id [integer] The ID of the resource that is shared.

# Returns

readers [dict::]

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id: integer
  - name: string

```
writers [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id : integer
                                     - name: string
                  owners [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id: integer
                                     name : string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                       and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.
list_types()
     List all available model types
            Returns
                  id [integer] The ID of the model type.
                  algorithm [string] The name of the algorithm used to train the model.
                  dv_type [string] The type of dependent variable predicted by the model.
                  fint_allowed [boolean] Whether this model type supports searching for interaction
                       terms.
\mathtt{patch} (id,
                   *.

                                                                                               num-
                                      notifications='DEFAULT',
        ber_of_folds='DEFAULT',
                                                                     schedule='DEFAULT',
                                                                                               par-
        ent id='DEFAULT', time zone='DEFAULT')
      Update model configuration
           Parameters
                  id [integer] The ID of the model.
                  table name [string, optional] The qualified name of the table containing the training
                       set from which to build the model.
                  database id [integer, optional] The ID of the database holding the training set table
                       used to build the model.
                  credential_id [integer, optional] The ID of the credential used to read the target table.
                       Defaults to the user's default credential.
                  model_name [string, optional] The name of the model.
```

6.5. API Client 303

**interaction\_terms** [boolean, optional] Whether to search for interaction terms.

**description** [string, optional] A description of the model.

**box\_cox\_transformation** [boolean, optional] Whether to transform data so that it assumes a normal distribution. Valid only with continuous models.

**model\_type\_id** [integer, optional] The ID of the model's type.

primary\_key [string, optional] The unique ID (primary key) of the training dataset.

 $\label{lem:continuous} \textbf{dependent\_variable} \hspace{0.2cm} \text{[string, optional]} \hspace{0.2cm} \textbf{The dependent variable of the training dataset.}$ 

**dependent\_variable\_order** [list, optional] The order of dependent variables, especially useful for Ordinal Modeling.

**excluded\_columns** [list, optional] A list of columns which will be considered ineligible to be independent variables.

**limiting\_sql** [string, optional] A custom SQL WHERE clause used to filter the rows used to build the model. (e.g., "id > 105").

active\_build\_id [integer, optional] The ID of the current active build, the build used
to score predictions.

**cross\_validation\_parameters** [dict, optional] Cross validation parameter grid for tree methods, e.g. {"n\_estimators": [100, 200, 500], "learning\_rate": [0.01, 0.1], "max\_depth": [2, 3]}.

number\_of\_folds [integer, optional] Number of folds for cross validation. Default value is 5.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] The ID of the parent job that will trigger this model.time zone [string, optional] The time zone of this model.

Returns

### None Response code 204: success

post (\*, table\_name='DEFAULT', database id='DEFAULT', credential id='DEFAULT', model name='DEFAULT', description='DEFAULT', interaction terms='DEFAULT', box\_cox\_transformation='DEFAULT', model\_type\_id='DEFAULT', primary\_key='DEFAULT'. dependent\_variable='DEFAULT', dependent\_variable\_order='DEFAULT', limiting\_sql='DEFAULT'. cluded columns='DEFAULT', active build id='DEFAULT', cross validation parameters='DEFAULT', number of folds='DEFAULT', notifications='DEFAULT', schedule='DEFAULT', parent id='DEFAULT', time zone='DEFAULT', hidden='DEFAULT' Create new configuration for a model

### **Parameters**

**table\_name** [string, optional] The qualified name of the table containing the training set from which to build the model.

**database\_id** [integer, optional] The ID of the database holding the training set table used to build the model.

**credential\_id** [integer, optional] The ID of the credential used to read the target table. Defaults to the user's default credential.

model\_name [string, optional] The name of the model.

description [string, optional] A description of the model.

interaction\_terms [boolean, optional] Whether to search for interaction terms.

**box\_cox\_transformation** [boolean, optional] Whether to transform data so that it assumes a normal distribution. Valid only with continuous models.

**model\_type\_id** [integer, optional] The ID of the model's type.

primary\_key [string, optional] The unique ID (primary key) of the training dataset.

**dependent\_variable** [string, optional] The dependent variable of the training dataset.

**dependent\_variable\_order** [list, optional] The order of dependent variables, especially useful for Ordinal Modeling.

**excluded\_columns** [list, optional] A list of columns which will be considered ineligible to be independent variables.

**limiting\_sql** [string, optional] A custom SQL WHERE clause used to filter the rows used to build the model. (e.g., "id > 105").

active\_build\_id [integer, optional] The ID of the current active build, the build used to score predictions.

**cross\_validation\_parameters** [dict, optional] Cross validation parameter grid for tree methods, e.g. {"n\_estimators": [100, 200, 500], "learning\_rate": [0.01, 0.1], "max\_depth": [2, 3]}.

**number\_of\_folds** [integer, optional] Number of folds for cross validation. Default value is 5.

notifications [dict. optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the

job fails.

- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent id [integer, optional] The ID of the parent job that will trigger this model.

time\_zone [string, optional] The time zone of this model.

hidden [boolean, optional] The hidden status of the item.

#### Returns

id [integer] The ID of the model.

**table\_name** [string] The qualified name of the table containing the training set from which to build the model.

**database\_id** [integer] The ID of the database holding the training set table used to build the model.

credential\_id [integer] The ID of the credential used to read the target table. Defaults to the user's default credential.

**model\_name** [string] The name of the model.

**description** [string] A description of the model.

**interaction\_terms** [boolean] Whether to search for interaction terms.

**box\_cox\_transformation** [boolean] Whether to transform data so that it assumes a normal distribution. Valid only with continuous models.

model\_type\_id [integer] The ID of the model's type.

primary\_key [string] The unique ID (primary key) of the training dataset.

dependent\_variable [string] The dependent variable of the training dataset.

**dependent\_variable\_order** [list] The order of dependent variables, especially useful for Ordinal Modeling.

**excluded\_columns** [list] A list of columns which will be considered ineligible to be independent variables.

**limiting\_sql** [string] A custom SQL WHERE clause used to filter the rows used to build the model. (e.g., "id > 105").

active\_build\_id [integer] The ID of the current active build, the build used to score
predictions.

**cross\_validation\_parameters** [dict] Cross validation parameter grid for tree methods, e.g. {"n\_estimators": [100, 200, 500], "learning\_rate": [0.01, 0.1], "max depth": [2, 3]}.

number\_of\_folds [integer] Number of folds for cross validation. Default value is 5.
notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.

- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] The ID of the parent job that will trigger this model.
running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**time\_zone** [string] The time zone of this model.

last run [dict::]

- id: integer
- state : string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.

- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**created at** [string/date-time] The time the model was created.

updated\_at [string/date-time] The time the model was updated.

current\_build\_state [string] The status of the current model build. One of "succeeded", "failed", "queued", or "running," or "idle", if no build has been attempted.

current\_build\_exception [string] Exception message, if applicable, of the current model build.

**builds** [list::] A list of trained models available for making predictions. - id : integer

The ID of the model build.

- name [string] The name of the model build.
- **created\_at** [string] The time the model build was created.
- **description** [string] A description of the model build.
- root\_mean\_squared\_error [number/float] A key metric for continuous models. Nil for other model types.
- r\_squared\_error [number/float] A key metric for continuous models.

  Nil for other model types.
- roc\_auc [number/float] A key metric for binary, multinomial, and ordinal models. Nil for other model types.

**predictions** [list::] The tables upon which the model will be applied. - id: integer

The ID of the model to which to apply the prediction.

- **table\_name** [string] The qualified name of the table on which to apply the predictive model.
- **primary\_key** [list] The primary key or composite keys of the table being predicted.
- **limiting\_sql** [string] A SQL WHERE clause used to scope the rows to be predicted.
- **output\_table** [string] The qualified name of the table to be created which will contain the model's predictions.
- schedule [dict::]
  - **scheduled** [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
  - scheduled\_runs\_per\_hour [integer] Alternative to scheduled minutes, number of times to run per hour.
- **state** [string] The status of the prediction. One of: "succeeded", "failed", "queued", or "running," or "idle", if no build has been attempted.

**last\_output\_location** [string] The output JSON for the last build. **archived** [string] The archival status of the requested item(s).

# post\_builds (id)

Start a build

#### **Parameters**

id [integer] The ID of the model.

#### Returns

id [integer] The ID of the model build.

state [string] The state of the model build.one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**error** [string] The error, if any, returned by the build.

**name** [string] The name of the model build.

created\_at [string] The time the model build was created.

**description** [string] A description of the model build.

root\_mean\_squared\_error [number/float] A key metric for continuous models. Nil for other model types.

r\_squared\_error [number/float] A key metric for continuous models. Nil for other model types.

**roc\_auc** [number/float] A key metric for binary, multinomial, and ordinal models. Nil for other model types.

**transformation\_metadata** [string] A string representing the full JSON output of the metadata for transformation of column names

**output** [string] A string representing the JSON output for the specified build. Only present when smaller than 10KB in size.

**output\_location** [string] A URL representing the location of the full JSON output for the specified build. The URL link will be valid for 5 minutes.

# put\_archive (id, status)

Update the archive status of this object

## **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

### **Returns**

id [integer] The ID of the model.

**table\_name** [string] The qualified name of the table containing the training set from which to build the model.

database\_id [integer] The ID of the database holding the training set table used to build the model.

credential\_id [integer] The ID of the credential used to read the target table. Defaults to the user's default credential.

**model name** [string] The name of the model.

**description** [string] A description of the model.

**interaction\_terms** [boolean] Whether to search for interaction terms.

**box\_cox\_transformation** [boolean] Whether to transform data so that it assumes a normal distribution. Valid only with continuous models.

model\_type\_id [integer] The ID of the model's type.

**primary key** [string] The unique ID (primary key) of the training dataset.

**dependent\_variable** [string] The dependent variable of the training dataset.

**dependent\_variable\_order** [list] The order of dependent variables, especially useful for Ordinal Modeling.

**excluded\_columns** [list] A list of columns which will be considered ineligible to be independent variables.

**limiting\_sql** [string] A custom SQL WHERE clause used to filter the rows used to build the model. (e.g., "id > 105").

- active\_build\_id [integer] The ID of the current active build, the build used to score predictions.
- **cross\_validation\_parameters** [dict] Cross validation parameter grid for tree methods, e.g. {"n\_estimators": [100, 200, 500], "learning\_rate": [0.01, 0.1], "max depth": [2, 3]}.

number\_of\_folds [integer] Number of folds for cross validation. Default value is 5.
notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] The ID of the parent job that will trigger this model.
running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**time\_zone** [string] The time zone of this model.

last\_run [dict::]

• id: integer

• state: string

- **created\_at** [string/time] The time that the run was queued.
- started at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item. **user** [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/date-time] The time the model was created.

**updated\_at** [string/date-time] The time the model was updated.

current\_build\_state [string] The status of the current model build. One of "succeeded", "failed", "queued", or "running," or "idle", if no build has been attempted.

current\_build\_exception [string] Exception message, if applicable, of the current model build.

builds [list::] A list of trained models available for making predictions. - id: integer

The ID of the model build.

- name [string] The name of the model build.
- **created\_at** [string] The time the model build was created.
- **description** [string] A description of the model build.
- **root\_mean\_squared\_error** [number/float] A key metric for continuous models. Nil for other model types.
- r\_squared\_error [number/float] A key metric for continuous models.

  Nil for other model types.
- **roc\_auc** [number/float] A key metric for binary, multinomial, and ordinal models. Nil for other model types.

predictions [list::] The tables upon which the model will be applied. - id: integer

The ID of the model to which to apply the prediction.

- **table\_name** [string] The qualified name of the table on which to apply the predictive model.
- **primary\_key** [list] The primary key or composite keys of the table being predicted.
- **limiting\_sql** [string] A SQL WHERE clause used to scope the rows to be predicted.
- **output\_table** [string] The qualified name of the table to be created which will contain the model's predictions.
- schedule [dict::]
  - scheduled [boolean] If the item is scheduled.

- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- scheduled\_runs\_per\_hour [integer] Alternative to scheduled minutes, number of times to run per hour.
- **state** [string] The status of the prediction. One of: "succeeded", "failed", "queued", or "running," or "idle", if no build has been attempted.

**last\_output\_location** [string] The output JSON for the last build. **archived** [string] The archival status of the requested item(s).

put\_predictions (id, table\_name, primary\_key, \*, limiting\_sql='DEFAULT', output\_table='DEFAULT', schedule='DEFAULT')

Add a table on which to apply the predictive model

#### **Parameters**

id [integer] The ID of the model to which to apply the prediction.

**table\_name** [string] The qualified name of the table on which to apply the predictive model.

primary\_key [list] The primary key or composite keys of the table being predicted.
limiting\_sql [string, optional] A SQL WHERE clause used to scope the rows to be predicted.

output\_table [string, optional] The qualified name of the table to be created which will contain the model's predictions.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

# Returns

id [integer] The ID of the model to which to apply the prediction.

**table\_name** [string] The qualified name of the table on which to apply the predictive model.

primary\_key [list] The primary key or composite keys of the table being predicted.limiting\_sql [string] A SQL WHERE clause used to scope the rows to be predicted.output\_table [string] The qualified name of the table to be created which will contain the model's predictions.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

```
state [string] The status of the prediction. One of: "succeeded", "failed", "queued",
                        or "running," or "idle", if no build has been attempted.
put_projects (id, project_id)
      Add a models to a project
            Parameters
                  id [integer] The ID of the resource.
                  project id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_schedules (id, schedule)
      Schedule the model build
            Parameters
                  id [integer] The ID of the model associated with this schedule.
                  schedule [dict::]
                            • scheduled [boolean] If the item is scheduled.
                            • scheduled days [list] Day based on numeric value starting at 0 for Sun-
                                   day.
                            • scheduled hours [list] Hours of the day it is scheduled on.
                            • scheduled minutes [list] Minutes of the day it is scheduled on.
                            • scheduled runs per hour [integer] Alternative to scheduled minutes,
                                   number of times to run per hour.
            Returns
                  id [integer] The ID of the model associated with this schedule.
                  schedule [dict::]
                            • scheduled [boolean] If the item is scheduled.
                            • scheduled_days [list] Day based on numeric value starting at 0 for Sun-
                                   day.
                            • scheduled_hours [list] Hours of the day it is scheduled on.
                            • scheduled_minutes [list] Minutes of the day it is scheduled on.
                            • scheduled_runs_per_hour [integer] Alternative to scheduled minutes,
                                   number of times to run per hour.
                               group_ids, permission_level, *, share_email_body='DEFAULT',
put_shares_groups (id,
                          send_shared_email='DEFAULT')
     Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group ids [list] An array of one or more group IDs.
                  permission level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
```

```
- id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name : string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                      - name: string
                  total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total group shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put_shares_users (id,
                               user_ids,
                                           permission_level,
                                                                      share_email_body='DEFAULT',
                         send_shared_email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
```

```
- id: integer
                                          - name : string
                       owners [dict::]
                                 • users [list::]
                                          - id: integer
                                          - name : string
                                 • groups [list::]
                                          - id: integer
                                          - name: string
                       total_user_shares [integer] For owners, the number of total users shared. For writers
                             and readers, the number of visible users shared.
                       total_group_shares [integer] For owners, the number of total groups shared. For writ-
                             ers and readers, the number of visible groups shared.
class Notebooks (session_kwargs, return_type='civis')
     delete_deployments (notebook_id, deployment_id)
           Delete a Notebook deployment
                 Parameters
                       notebook_id [integer] The ID of the owning Notebook
                       deployment_id [integer] The ID for this deployment
                 Returns
                       None Response code 204: success
     delete_projects (id, project_id)
           Remove a Notebook from a project
                 Parameters
                       id [integer] The ID of the resource.
                       project_id [integer] The ID of the project.
                 Returns
                       None Response code 204: success
     delete_shares_groups (id, group_id)
           Revoke the permissions a group has on this object
                 Parameters
                       id [integer] The ID of the resource that is shared.
                       group_id [integer] The ID of the group.
                 Returns
                       None Response code 204: success
     delete_shares_users (id, user_id)
           Revoke the permissions a user has on this object
                 Parameters
```

**Notebooks** 

**Methods** 

6.5. API Client 315

id [integer] The ID of the resource that is shared.

**user\_id** [integer] The ID of the user.

#### Returns

None Response code 204: success

get (id)

Get a Notebook

### **Parameters**

id [integer]

#### Returns

id [integer] The ID for this notebook.

name [string] The name of this notebook.

language [string] The kernel language of this notebook.

description [string] The description of this notebook.

notebook\_url [string] Time-limited URL to get the .ipynb file for this notebook.

**notebook\_preview\_url** [string] Time-limited URL to get the .htm preview file for this notebook.

**requirements\_url** [string] Time-limited URL to get the requirements.txt file for this notebook.

**file\_id** [string] The file ID for the S3 file containing the .ipynb file.

**requirements\_file\_id** [string] The file ID for the S3 file containing the requirements.txt file.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to.

memory [integer] The amount of memory allocated to the notebook.

**cpu** [integer] The amount of cpu allocated to the the notebook.

created\_at [string/time]

updated at [string/time]

most\_recent\_deployment [dict::]

- deployment\_id [integer] The ID for this deployment.
- user id [integer] The ID of the owner.
- host [string] Domain of the deployment.
- name [string] Name of the deployment.
- **docker\_image\_name** [string] The name of the docker image to pull from DockerHub.
- docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).
- display\_url [string] A signed URL for viewing the deployed item.
- instance\_type [string] The EC2 instance type requested for the deployment.

```
• memory [integer] The memory allocated to the deployment.
                            • cpu [integer] The cpu allocated to the deployment.
                            • state [string] The state of the deployment.
                            • state_message [string] A detailed description of the state.
                            · created at : string/time
                            • updated at : string/time
                            • published: boolean
                            • notebook_id [integer] The ID of owning Notebook
                  credentials [list] A list of credential IDs to pass to the notebook.
                  environment_variables [dict] Environment variables to be passed into the Notebook.
                  idle_timeout [integer] How long the notebook will stay alive without any kernel ac-
                        tivity.
                  git_repo_id [integer] The ID of the git repository.
                  git_repo_url [string] The url of the git repository
                  git ref [string] The git reference if git repo is specified
                  git path [string] The path to the .ipynb file in the git repo that will be started up on
                        notebook launch
                  archived [string] The archival status of the requested item(s).
                  hidden [boolean] The hidden status of the item.
get deployments (notebook id, deployment id)
      Get details about a Notebook deployment
                  notebook_id [integer] The ID of the owning Notebook
                  deployment_id [integer] The ID for this deployment
                  deployment id [integer] The ID for this deployment.
                  user_id [integer] The ID of the owner.
                  host [string] Domain of the deployment.
                  name [string] Name of the deployment.
                  docker_image_name [string] The name of the docker image to pull from DockerHub.
                  docker image tag [string] The tag of the docker image to pull from DockerHub (de-
                        fault: latest).
                  display url [string] A signed URL for viewing the deployed item.
                  instance type [string] The EC2 instance type requested for the deployment.
                  memory [integer] The memory allocated to the deployment.
                  cpu [integer] The cpu allocated to the deployment.
                  state [string] The state of the deployment.
                  state message [string] A detailed description of the state.
                  created at [string/time]
                  updated_at [string/time]
                  published [boolean]
                  notebook_id [integer] The ID of owning Notebook
get_git_commits (id, commit_hash)
      Get file contents at commit hash
                  id [integer] The ID of the file.
                  commit_hash [string] The SHA (full or shortened) of the desired git commit.
                  content [string] The file's contents.
```

**Parameters** 

**Parameters** 

Returns

Returns

```
type [string] The file's type.size [integer] The file's size.file_hash [string] The SHA of the file.
```

list (\*, hidden='DEFAULT', archived='DEFAULT', author='DEFAULT', status='DEFAULT',
 limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT',
 iterator='DEFAULT')
 List Notebooks

# **Parameters**

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**archived** [string, optional] The archival status of the requested item(s).

**author** [string, optional] If specified, return imports from this author. It accepts a comma-separated list of author IDs.

**status** [string, optional] If specified, returns notebooks with one of these statuses. It accepts a comma-separated list, possible values are 'running', 'pending', 'idle'.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

### Returns

id [integer] The ID for this notebook.name [string] The name of this notebook.language [string] The kernel language of this notebook.description [string] The description of this notebook.user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/time]
updated\_at [string/time]
most\_recent\_deployment [dict::]

- deployment\_id [integer] The ID for this deployment.
- user\_id [integer] The ID of the owner.
- host [string] Domain of the deployment.
- name [string] Name of the deployment.
- docker\_image\_name [string] The name of the docker image to pull from DockerHub.
- docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

- instance\_type [string] The EC2 instance type requested for the deployment.
- **memory** [integer] The memory allocated to the deployment.
- cpu [integer] The cpu allocated to the deployment.
- state [string] The state of the deployment.
- state message [string] A detailed description of the state.
- created at : string/time
- updated\_at : string/time
- published : boolean
- notebook\_id [integer] The ID of owning Notebook

**archived** [string] The archival status of the requested item(s).

List deployments for a Notebook

#### **Parameters**

notebook\_id [integer] The ID of the owning Notebook

deployment\_id [integer, optional] The ID for this deployment

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to created\_at. Must be one of: created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

## Returns

**deployment\_id** [integer] The ID for this deployment.

user\_id [integer] The ID of the owner.

**host** [string] Domain of the deployment.

**name** [string] Name of the deployment.

docker image name [string] The name of the docker image to pull from DockerHub.

docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type requested for the deployment.

**memory** [integer] The memory allocated to the deployment.

cpu [integer] The cpu allocated to the deployment.

**state** [string] The state of the deployment.

**state\_message** [string] A detailed description of the state.

created\_at [string/time]

updated\_at [string/time]

published [boolean]

notebook\_id [integer] The ID of owning Notebook

## **Parameters**

id [integer] The ID of the owning Notebook.

**deployment\_id** [integer] The ID for this deployment.

start\_at [string, optional] Log entries with a lower timestamp will be omitted.

end at [string, optional] Log entries with a higher timestamp will be omitted.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

#### Returns

message [string] The log message.

**stream** [string] The stream of the log. One of "stdout", "stderr".

created\_at [string/date-time] The time the log was created.

**source** [string] The source of the log. One of "system", "user".

# list\_git (id)

Get the git metadata attached to this Notebook

### **Parameters**

id [integer] The ID of the file.

#### **Returns**

git\_ref [string] A git reference specifying an unambiguous version of the file. Can be a branch name, or the full or shortened SHA of a commit.

git branch [string] The git branch that the file is on.

git\_path [string] The path of the file in the repository.

git\_repo [dict::]

- id [integer] The ID for this git repository.
- **repo\_url** [string] The URL for this git repository.
- created\_at : string/time
- updated\_at : string/time

# $list_git_commits(id)$

Get the git commits for this Notebook

# **Parameters**

id [integer] The ID of the file.

## Returns

**commit\_hash** [string] The SHA of the commit.

**author\_name** [string] The name of the commit's author.

date [string/time] The commit's timestamp.

message [string] The commit message.

# list\_projects(id, \*, hidden='DEFAULT')

List the projects a Notebook belongs to

## **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

#### Returns

id [integer] The ID for this project.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.

```
• online [boolean] Whether this user is online.
                  name [string] The name of this project.
                  description [string] A description of the project.
                  users [list::] Users who can see the project. - id : integer
                               The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  auto_share [boolean]
                  created_at [string/time]
                  updated_at [string/time]
                  archived [string] The archival status of the requested item(s).
list shares (id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  writers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  owners [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name : string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
```

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

## list\_update\_links(id)

Get URLs to update notebook

#### **Parameters**

id [integer]

#### Returns

update\_url [string] Time-limited URL to PUT new contents of the .ipynb file for this
notebook.

update\_preview\_url [string] Time-limited URL to PUT new contents of the .htm preview file for this notebook.

patch (id, \*, name='DEFAULT', language='DEFAULT', description='DEFAULT',
 file\_id='DEFAULT', requirements\_file\_id='DEFAULT', requirements='DEFAULT',
 docker\_image\_name='DEFAULT', docker\_image\_tag='DEFAULT', in stance\_type='DEFAULT', memory='DEFAULT', cpu='DEFAULT', credentials='DEFAULT',
 environment\_variables='DEFAULT', idle\_timeout='DEFAULT', git\_repo\_url='DEFAULT',
 git\_ref='DEFAULT', git\_path='DEFAULT')
Update some attributes of this Notebook

#### **Parameters**

id [integer] The ID for this notebook.

**name** [string, optional] The name of this notebook.

**language** [string, optional] The kernel language of this notebook.

**description** [string, optional] The description of this notebook.

**file\_id** [string, optional] The file ID for the S3 file containing the .ipynb file.

**requirements\_file\_id** [string, optional] The file ID for the S3 file containing the requirements.txt file.

**requirements** [string, optional] The requirements txt file.

**docker\_image\_name** [string, optional] The name of the docker image to pull from DockerHub.

**docker\_image\_tag** [string, optional] The tag of the docker image to pull from DockerHub (default: latest).

instance\_type [string, optional] The EC2 instance type to deploy to.

**memory** [integer, optional] The amount of memory allocated to the notebook.

**cpu** [integer, optional] The amount of cpu allocated to the the notebook.

**credentials** [list, optional] A list of credential IDs to pass to the notebook.

**environment\_variables** [dict, optional] Environment variables to be passed into the Notebook.

**idle\_timeout** [integer, optional] How long the notebook will stay alive without any kernel activity.

git\_repo\_url [string, optional] The url of the git repository

git\_ref [string, optional] The git reference if git repo is specified

**git\_path** [string, optional] The path to the .ipynb file in the git repo that will be started up on notebook launch

## Returns

id [integer] The ID for this notebook.

**name** [string] The name of this notebook.

language [string] The kernel language of this notebook.

**description** [string] The description of this notebook.

**notebook url** [string] Time-limited URL to get the .ipynb file for this notebook.

**notebook\_preview\_url** [string] Time-limited URL to get the .htm preview file for this notebook.

**requirements\_url** [string] Time-limited URL to get the requirements.txt file for this notebook.

file\_id [string] The file ID for the S3 file containing the .ipynb file.
requirements\_file\_id [string] The file ID for the S3 file containing the requirements.txt file.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to.

memory [integer] The amount of memory allocated to the notebook.

cpu [integer] The amount of cpu allocated to the the notebook.

created\_at [string/time]

updated\_at [string/time]

most recent deployment [dict::]

- **deployment\_id** [integer] The ID for this deployment.
- user\_id [integer] The ID of the owner.
- host [string] Domain of the deployment.
- name [string] Name of the deployment.
- **docker\_image\_name** [string] The name of the docker image to pull from DockerHub.
- docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).
- display\_url [string] A signed URL for viewing the deployed item.
- **instance\_type** [string] The EC2 instance type requested for the deployment.
- memory [integer] The memory allocated to the deployment.
- ullet cpu [integer] The cpu allocated to the deployment.
- state [string] The state of the deployment.
- state message [string] A detailed description of the state.
- created\_at : string/time
- updated\_at : string/time
- published: boolean
- notebook\_id [integer] The ID of owning Notebook

**credentials** [list] A list of credential IDs to pass to the notebook.

environment\_variables [dict] Environment variables to be passed into the Notebook.
idle\_timeout [integer] How long the notebook will stay alive without any kernel activity.

git\_repo\_id [integer] The ID of the git repository.
git repo url [string] The url of the git repository

```
git ref [string] The git reference if git repo is specified
```

git\_path [string] The path to the .ipynb file in the git repo that will be started up on notebook launch

**archived** [string] The archival status of the requested item(s).

**hidden** [boolean] The hidden status of the item.

## **Parameters**

**name** [string, optional] The name of this notebook.

**language** [string, optional] The kernel language of this notebook.

**description** [string, optional] The description of this notebook.

**file\_id** [string, optional] The file ID for the S3 file containing the .ipynb file.

**requirements\_file\_id** [string, optional] The file ID for the S3 file containing the requirements.txt file.

**requirements** [string, optional] The requirements txt file.

docker\_image\_name [string, optional] The name of the docker image to pull from DockerHub.

docker\_image\_tag [string, optional] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string, optional] The EC2 instance type to deploy to.

**memory** [integer, optional] The amount of memory allocated to the notebook.

**cpu** [integer, optional] The amount of cpu allocated to the the notebook.

**credentials** [list, optional] A list of credential IDs to pass to the notebook.

**environment\_variables** [dict, optional] Environment variables to be passed into the Notebook.

**idle\_timeout** [integer, optional] How long the notebook will stay alive without any kernel activity.

git\_repo\_url [string, optional] The url of the git repository

git\_ref [string, optional] The git reference if git repo is specified

**git\_path** [string, optional] The path to the .ipynb file in the git repo that will be started up on notebook launch

**hidden** [boolean, optional] The hidden status of the item.

## Returns

id [integer] The ID for this notebook.

name [string] The name of this notebook.

language [string] The kernel language of this notebook.

**description** [string] The description of this notebook.

**notebook url** [string] Time-limited URL to get the .ipynb file for this notebook.

**notebook\_preview\_url** [string] Time-limited URL to get the .htm preview file for this notebook.

**requirements\_url** [string] Time-limited URL to get the requirements.txt file for this notebook.

**file\_id** [string] The file ID for the S3 file containing the .ipynb file.

**requirements\_file\_id** [string] The file ID for the S3 file containing the requirements.txt file.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.

```
• username [string] This user's username.
```

- initials [string] This user's initials.
- online [boolean] Whether this user is online.

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to.

**memory** [integer] The amount of memory allocated to the notebook.

**cpu** [integer] The amount of cpu allocated to the the notebook.

created\_at [string/time]

updated\_at [string/time]

most\_recent\_deployment [dict::]

- **deployment\_id** [integer] The ID for this deployment.
- user\_id [integer] The ID of the owner.
- host [string] Domain of the deployment.
- name [string] Name of the deployment.
- **docker\_image\_name** [string] The name of the docker image to pull from DockerHub.
- docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).
- display\_url [string] A signed URL for viewing the deployed item.
- **instance\_type** [string] The EC2 instance type requested for the deployment.
- **memory** [integer] The memory allocated to the deployment.
- cpu [integer] The cpu allocated to the deployment.
- state [string] The state of the deployment.
- state\_message [string] A detailed description of the state.

• created\_at : string/time

• updated at : string/time

• published : boolean

• notebook\_id [integer] The ID of owning Notebook

**credentials** [list] A list of credential IDs to pass to the notebook.

environment\_variables [dict] Environment variables to be passed into the Notebook.

**idle\_timeout** [integer] How long the notebook will stay alive without any kernel activity.

git\_repo\_id [integer] The ID of the git repository.

git\_repo\_url [string] The url of the git repository

git\_ref [string] The git reference if git repo is specified

git\_path [string] The path to the .ipynb file in the git repo that will be started up on notebook launch

**archived** [string] The archival status of the requested item(s).

hidden [boolean] The hidden status of the item.

## post automate(id)

Automate this notebook via a script

#### **Parameters**

id [integer]

#### Returns

id [integer] The ID for the script.

name [string] The name of the container.
type [string] The type of the script (e.g Container)

**created at** [string/time] The time this script was created.

**updated at** [string/time] The time the script was created.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script
user\_context [string] "runner" or "author", who to execute the script as when run as

a template.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is template** [boolean] Whether others scripts use this one as a template.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

**template\_script\_name** [string] The name of the template script.

links [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled hours [list] Hours of the day it is scheduled on.
  - scheduled minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

#### required resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- memory [integer] The amount of RAM to allocate for the container (in MiB).
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**repo\_http\_uri** [string] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.

**repo\_ref** [string] The tag or branch of the github repo to clone into the container.

**remote\_host\_credential\_id** [integer] The id of the database credentials to pass into the environment of the container.

**git\_credential\_id** [integer] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.

**docker\_command** [string] The command to run on the container. Will be run via sh as: ["sh", "-c", dockerCommand].

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to

last\_run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

**time zone** [string] The time zone of this script.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

target\_project\_id [integer] Target project to which script outputs will be added.

```
post_clone (id)
```

Clone this Notebook

#### **Parameters**

id [integer]

## **Returns**

id [integer] The ID for this notebook.

**name** [string] The name of this notebook.

language [string] The kernel language of this notebook.

**description** [string] The description of this notebook.

**notebook url** [string] Time-limited URL to get the .ipynb file for this notebook.

**notebook\_preview\_url** [string] Time-limited URL to get the .htm preview file for this notebook.

**requirements\_url** [string] Time-limited URL to get the requirements.txt file for this notebook.

**file\_id** [string] The file ID for the S3 file containing the .ipynb file.

**requirements\_file\_id** [string] The file ID for the S3 file containing the requirements.txt file.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to.

memory [integer] The amount of memory allocated to the notebook.

**cpu** [integer] The amount of cpu allocated to the the notebook.

created\_at [string/time]

updated\_at [string/time]

most recent deployment [dict::]

- **deployment\_id** [integer] The ID for this deployment.
- user\_id [integer] The ID of the owner.
- host [string] Domain of the deployment.
- name [string] Name of the deployment.
- docker\_image\_name [string] The name of the docker image to pull from DockerHub.
- docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).
- display url [string] A signed URL for viewing the deployed item.
- instance\_type [string] The EC2 instance type requested for the deployment.
- **memory** [integer] The memory allocated to the deployment.
- cpu [integer] The cpu allocated to the deployment.
- state [string] The state of the deployment.
- state\_message [string] A detailed description of the state.
- created at : string/time
- updated\_at : string/time
- · published: boolean
- notebook\_id [integer] The ID of owning Notebook

credentials [list] A list of credential IDs to pass to the notebook.

**environment variables** [dict] Environment variables to be passed into the Notebook.

```
idle timeout [integer] How long the notebook will stay alive without any kernel ac-
                       tivity.
                 git repo id [integer] The ID of the git repository.
                 git_repo_url [string] The url of the git repository
                 git_ref [string] The git reference if git repo is specified
                 git path [string] The path to the .ipynb file in the git repo that will be started up on
                       notebook launch
                 archived [string] The archival status of the requested item(s).
                 hidden [boolean] The hidden status of the item.
post_deployments (notebook_id, *, deployment_id='DEFAULT', published='DEFAULT')
     Deploy a Notebook
           Parameters
                 notebook_id [integer] The ID of the owning Notebook
                 deployment_id [integer, optional] The ID for this deployment
                 published [boolean, optional]
            Returns
                 deployment_id [integer] The ID for this deployment.
                 user id [integer] The ID of the owner.
                 host [string] Domain of the deployment.
                 name [string] Name of the deployment.
                 docker_image_name [string] The name of the docker image to pull from DockerHub.
                 docker_image_tag [string] The tag of the docker image to pull from DockerHub (de-
                       fault: latest).
                 display url [string] A signed URL for viewing the deployed item.
                 instance type [string] The EC2 instance type requested for the deployment.
                 memory [integer] The memory allocated to the deployment.
                 cpu [integer] The cpu allocated to the deployment.
                 state [string] The state of the deployment.
                 state message [string] A detailed description of the state.
                 created_at [string/time]
                 updated at [string/time]
                 published [boolean]
                 notebook_id [integer] The ID of owning Notebook
post git commits (id, content, message, file hash)
      Commit and push a new version of the file
           Parameters
                 id [integer] The ID of the file.
                 content [string] The contents to commit to the file.
                 message [string] A commit message describing the changes being made.
                 file hash [string] The full SHA of the file being replaced.
           Returns
                 content [string] The file's contents.
                 type [string] The file's type.
                 size [integer] The file's size.
                 file_hash [string] The SHA of the file.
put (id, *, name='DEFAULT', language='DEFAULT', description='DEFAULT', file_id='DEFAULT',
     requirements_file_id='DEFAULT', requirements='DEFAULT', docker_image_name='DEFAULT',
     docker_image_tag='DEFAULT',
                                           instance_type='DEFAULT',
                                                                             memory='DEFAULT',
     cpu='DEFAULT',
                               credentials='DEFAULT',
                                                                environment variables='DEFAULT',
     idle_timeout='DEFAULT',
                                          git_repo_url='DEFAULT',
                                                                               git_ref='DEFAULT',
     git_path='DEFAULT')
     Replace all attributes of this Notebook
           Parameters
```

```
id [integer] The ID for this notebook.
```

name [string, optional] The name of this notebook.

**language** [string, optional] The kernel language of this notebook.

description [string, optional] The description of this notebook.

**file id** [string, optional] The file ID for the S3 file containing the .ipynb file.

**requirements\_file\_id** [string, optional] The file ID for the S3 file containing the requirements.txt file.

requirements [string, optional] The requirements txt file.

docker\_image\_name [string, optional] The name of the docker image to pull from DockerHub.

**docker\_image\_tag** [string, optional] The tag of the docker image to pull from DockerHub (default: latest).

instance\_type [string, optional] The EC2 instance type to deploy to.

**memory** [integer, optional] The amount of memory allocated to the notebook.

**cpu** [integer, optional] The amount of cpu allocated to the the notebook.

credentials [list, optional] A list of credential IDs to pass to the notebook.

environment\_variables [dict, optional] Environment variables to be passed into the Notebook.

**idle\_timeout** [integer, optional] How long the notebook will stay alive without any kernel activity.

git\_repo\_url [string, optional] The url of the git repository

git\_ref [string, optional] The git reference if git repo is specified

git\_path [string, optional] The path to the .ipynb file in the git repo that will be started
up on notebook launch

#### Returns

id [integer] The ID for this notebook.

**name** [string] The name of this notebook.

language [string] The kernel language of this notebook.

description [string] The description of this notebook.

**notebook\_url** [string] Time-limited URL to get the .ipynb file for this notebook.

notebook\_preview\_url [string] Time-limited URL to get the .htm preview file for this notebook.

**requirements\_url** [string] Time-limited URL to get the requirements.txt file for this notebook.

**file\_id** [string] The file ID for the S3 file containing the .ipynb file.

**requirements\_file\_id** [string] The file ID for the S3 file containing the requirements.txt file.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to.

memory [integer] The amount of memory allocated to the notebook.

cpu [integer] The amount of cpu allocated to the the notebook.

created at [string/time]

updated at [string/time]

## most\_recent\_deployment [dict::]

- **deployment\_id** [integer] The ID for this deployment.
- user\_id [integer] The ID of the owner.
- host [string] Domain of the deployment.
- name [string] Name of the deployment.
- docker\_image\_name [string] The name of the docker image to pull from DockerHub.
- docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).
- display\_url [string] A signed URL for viewing the deployed item.
- **instance\_type** [string] The EC2 instance type requested for the deployment.
- memory [integer] The memory allocated to the deployment.
- cpu [integer] The cpu allocated to the deployment.
- state [string] The state of the deployment.
- state\_message [string] A detailed description of the state.
- created\_at : string/time
- updated\_at : string/time
- published: boolean
- notebook\_id [integer] The ID of owning Notebook

credentials [list] A list of credential IDs to pass to the notebook.

environment\_variables [dict] Environment variables to be passed into the Notebook.

idle\_timeout [integer] How long the notebook will stay alive without any kernel activity.

git\_repo\_id [integer] The ID of the git repository.

git\_repo\_url [string] The url of the git repository

git\_ref [string] The git reference if git repo is specified

git\_path [string] The path to the .ipynb file in the git repo that will be started up on notebook launch

**archived** [string] The archival status of the requested item(s).

hidden [boolean] The hidden status of the item.

#### put archive (id, status)

Update the archive status of this object

## **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

#### Returns

id [integer] The ID for this notebook.

**name** [string] The name of this notebook.

**language** [string] The kernel language of this notebook.

**description** [string] The description of this notebook.

**notebook\_url** [string] Time-limited URL to get the .ipynb file for this notebook.

**notebook\_preview\_url** [string] Time-limited URL to get the .htm preview file for this notebook.

**requirements\_url** [string] Time-limited URL to get the requirements.txt file for this notebook.

**file\_id** [string] The file ID for the S3 file containing the .ipynb file.

**requirements\_file\_id** [string] The file ID for the S3 file containing the requirements.txt file.

user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

instance\_type [string] The EC2 instance type to deploy to.

memory [integer] The amount of memory allocated to the notebook.

cpu [integer] The amount of cpu allocated to the the notebook.

created\_at [string/time]

updated\_at [string/time]

```
git repo id [integer] The ID of the git repository.
                  git_repo_url [string] The url of the git repository
                  git ref [string] The git reference if git repo is specified
                  git_path [string] The path to the .ipynb file in the git repo that will be started up on
                        notebook launch
                  archived [string] The archival status of the requested item(s).
                  hidden [boolean] The hidden status of the item.
                          git_ref='DEFAULT',
put git (id,
                                                   git branch='DEFAULT',
                                                                                git path='DEFAULT',
           git_repo_url='DEFAULT')
      Attach this Notebook to a git repo/file
            Parameters
                  id [integer] The ID of the file.
                  git_ref [string, optional] A git reference specifying an unambiguous version of the
                        file. Can be a branch name, or the full or shortened SHA of a commit.
                  git_branch [string, optional] The git branch that the file is on.
                  git_path [string, optional] The path of the file in the repository.
                  git_repo_url [string, optional] The URL of the git repository.
            Returns
                  git_ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git branch [string] The git branch that the file is on.
                  git_path [string] The path of the file in the repository.
                  git repo [dict::]
                            • id [integer] The ID for this git repository.
                            • repo url [string] The URL for this git repository.
                            · created at : string/time
                            • updated_at : string/time
put_projects (id, project_id)
      Add a Notebook to a project
            Parameters
                  id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put shares groups (id, group ids, permission level,
                                                                 *, share email body='DEFAULT',
                          send shared email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send shared email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
```

```
- id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name : string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]

                                      - name: string
                  total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total group shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put_shares_users (id,
                               user_ids,
                                           permission_level,
                                                                      share_email_body='DEFAULT',
                         send_shared_email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
```

```
- name: string
                        owners [dict::]
                                 • users [list::]
                                           - id: integer
                                           - name: string
                                 • groups [list::]
                                           - id: integer
                                           - name : string
                        total_user_shares [integer] For owners, the number of total users shared. For writers
                             and readers, the number of visible users shared.
                        total_group_shares [integer] For owners, the number of total groups shared. For writ-
                             ers and readers, the number of visible groups shared.
Notifications
class Notifications (session_kwargs, return_type='civis')
     Methods
     list(*, last_event_id='DEFAULT', r='DEFAULT', mock='DEFAULT')
           Receive a stream of notifications as they come in
                  Parameters
                        last_event_id [string, optional] allows browser to keep track of last event fired
                        r [string, optional] specifies retry/reconnect timeout
                        mock [string, optional] used for testing
                 Returns
                        None Response code 200: success
Ontology
class Ontology (session_kwargs, return_type='civis')
     Methods
     list (*, subset='DEFAULT')
           List the ontology of column names Civis uses
                 Parameters
                        subset [string, optional] A subset of fields to return.
                 Returns
                        key [string]
                        title [string]
                        desc [string] A description of this field.
```

- id: integer

## aliases [list]

#### **Predictions**

class Predictions (session\_kwargs, return\_type='civis')

## **Methods**

 ${\tt delete\_runs}\ (id, run\_id)$ 

Cancel a run

## **Parameters**

id [integer] The ID of the prediction.run\_id [integer] The ID of the run.

#### Returns

None Response code 202: success

get (id)

Show the specified prediction

#### **Parameters**

id [integer] The ID of the prediction.

#### Returns

 $id \;\; [integer] \; The \; ID \; of the prediction.$ 

model\_id [integer] The ID of the model used for this prediction.

**scored\_table\_id** [integer] The ID of the source table for this prediction.

**scored\_table\_name** [string] The name of the source table for this prediction.

output\_table\_name [string] The name of the output table for this prediction.

state [string] The state of the last run of this prediction.

**error** [string] The error, if any, of the last run of this prediction.

**started\_at** [string/date-time] The start time of the last run of this prediction.

**finished\_at** [string/date-time] The end time of the last run of this prediction.

last run [dict::]

- id: integer
- state : string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

scored\_tables [list::] An array of created prediction tables. - id : integer

The ID of the table with created predictions.

- schema [string] The schema of table with created predictions.
- name [string] The name of table with created predictions.
- **created\_at** [string/date-time] The time when the table with created predictions was created.
- **score\_stats** [list::] An array of metrics on the created predictions. score\_name: string

The name of the score.

- histogram [list] The histogram of the distribution of scores.
- avg\_score [number/float] The average score.
- min\_score [number/float] The minimum score.
- max\_score [number/float] The maximum score.

## schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**limiting\_sql** [string] A SQL WHERE clause used to scope the rows to be predicted. **primary key** [list] The primary key or composite keys of the table being predicted.

#### get runs (id, run id)

Check status of a run

#### **Parameters**

**id** [integer] The ID of the prediction.

run id [integer] The ID of the run.

#### Returns

id [integer] The ID of the prediction run.

prediction\_id [integer] The ID of the prediction.

**state** [string] The state of the prediction run.

exception [string] The exception, if any, returned by the prediction run.

**name** [string] The name of table created by this predictions run.

created\_at [string/date-time] The time when the table with created predictions was created.

**score\_stats** [list::] An array of metrics on the created predictions. - score\_name : string

The name of the score.

- **histogram** [list] The histogram of the distribution of scores.
- avg score [number/float] The average score.
- min\_score [number/float] The minimum score.
- max\_score [number/float] The maximum score.

# list (\*, model\_id='DEFAULT')

List predictions

## **Parameters**

model\_id [integer, optional] If specified, only return predictions associated with this model ID.

# Returns

id [integer] The ID of the prediction.

**model id** [integer] The ID of the model used for this prediction.

scored table id [integer] The ID of the source table for this prediction.

```
scored_table_name [string] The name of the source table for this prediction.
output_table_name [string] The name of the output table for this prediction.
state [string] The state of the last run of this prediction.
error [string] The error, if any, of the last run of this prediction.
started_at [string/date-time] The start time of the last run of this prediction.
finished_at [string/date-time] The end time of the last run of this prediction.
last run [dict::]
```

- id: integer
- state : string
- created\_at [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

```
list_runs (id, *, limit='DEFAULT', page_num='DEFAULT', order='DEFAULT', order_dir='DEFAULT', iterator='DEFAULT')
List runs for the given prediction
```

#### **Parameters**

**id** [integer] The ID of the prediction.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The ID of the prediction run.

prediction\_id [integer] The ID of the prediction.

state [string] The state of the prediction run.

**exception** [string] The exception, if any, returned by the prediction run.

**name** [string] The name of table created by this predictions run.

created\_at [string/date-time] The time when the table with created predictions was created.

**score\_stats** [list::] An array of metrics on the created predictions. - score\_name : string

The name of the score.

- histogram [list] The histogram of the distribution of scores.
- avg\_score [number/float] The average score.
- min\_score [number/float] The minimum score.
- max\_score [number/float] The maximum score.

list\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')
Get the logs for a run

**Parameters** 

```
id [integer] The ID of the prediction.
```

run\_id [integer] The ID of the run.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

#### Returns

id [integer] The ID of the log.

created\_at [string/date-time] The time the log was created.

message [string] The log message.

level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

#### list schedules (id)

Show the prediction schedule

## **Parameters**

id [integer] ID of the prediction associated with this schedule.

#### **Returns**

id [integer] ID of the prediction associated with this schedule.
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**score\_on\_model\_build** [boolean] Whether the prediction will run after a rebuild of the associated model.

## **Parameters**

id [integer] The ID of the prediction.

output\_table\_name [string, optional] The name of the output table for this prediction.
limiting\_sql [string, optional] A SQL WHERE clause used to scope the rows to be predicted.

primary\_key [list, optional] The primary key or composite keys of the table being predicted.

# Returns

id [integer] The ID of the prediction.

**model\_id** [integer] The ID of the model used for this prediction.

**scored\_table\_id** [integer] The ID of the source table for this prediction.

**scored\_table\_name** [string] The name of the source table for this prediction.

output\_table\_name [string] The name of the output table for this prediction.

**state** [string] The state of the last run of this prediction.

**error** [string] The error, if any, of the last run of this prediction.

**started\_at** [string/date-time] The start time of the last run of this prediction.

finished\_at [string/date-time] The end time of the last run of this prediction.

last\_run [dict::]

• id: integer

- state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present. scored\_tables [list::] An array of created prediction tables. id : integer

The ID of the table with created predictions.

- schema [string] The schema of table with created predictions.
- name [string] The name of table with created predictions.
- created\_at [string/date-time] The time when the table with created predictions was created.
- score\_stats [list::] An array of metrics on the created predictions. score\_name: string

The name of the score.

- **histogram** [list] The histogram of the distribution of scores.
- avg\_score [number/float] The average score.
- min score [number/float] The minimum score.
- **max score** [number/float] The maximum score.

# schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**limiting\_sql** [string] A SQL WHERE clause used to scope the rows to be predicted. **primary key** [list] The primary key or composite keys of the table being predicted.

# post\_runs (id) Start a run

## **Parameters**

id [integer] The ID of the prediction.

# Returns

id [integer] The ID of the prediction run.

prediction\_id [integer] The ID of the prediction.

state [string] The state of the prediction run.

**exception** [string] The exception, if any, returned by the prediction run.

**name** [string] The name of table created by this predictions run.

**score\_stats** [list::] An array of metrics on the created predictions. - score\_name : string

The name of the score.

- **histogram** [list] The histogram of the distribution of scores.
- avg\_score [number/float] The average score.
- min\_score [number/float] The minimum score.
- max\_score [number/float] The maximum score.

#### **Parameters**

id [integer] ID of the prediction associated with this schedule.
schedule [dict, optional::]

- **scheduled** [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

score\_on\_model\_build [boolean, optional] Whether the prediction will run after a rebuild of the associated model.

#### Returns

id [integer] ID of the prediction associated with this schedule.
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

score\_on\_model\_build [boolean] Whether the prediction will run after a rebuild of the associated model.

# **Projects**

class Projects (session\_kwargs, return\_type='civis')

## **Methods**

delete\_shares\_groups (id, group\_id)

Revoke the permissions a group has on this object

#### **Parameters**

id [integer] The ID of the resource that is shared.

```
group_id [integer] The ID of the group.
            Returns
                  None Response code 204: success
delete_shares_users (id, user_id)
      Revoke the permissions a user has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user id [integer] The ID of the user.
            Returns
                  None Response code 204: success
get (project_id)
      Get a detailed view of a project and the objects in it
            Parameters
                  project_id [integer]
            Returns
                  id [integer] The ID for this project.
                  author [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  name [string] The name of this project.
                  description [string] A description of the project.
                  users [list::] Users who can see the project. - id : integer
                              The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  auto_share [boolean]
                  created_at [string/time]
                  updated_at [string/time]
                  tables [list::]
                            · schema: string
                            • name : string

6.5. API Client 345

note [string]

• archived [string] The archival status of the requested item(s).

**hidden** [boolean] The hidden status of the item. **archived** [string] The archival status of the requested item(s).

list (\*, author='DEFAULT', permission='DEFAULT', hidden='DEFAULT', archived='DEFAULT',
 limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', itera tor='DEFAULT')
 List projects

## **Parameters**

**author** [string, optional] If specified, return projects owned by this author. It accepts a comma- separated list of author ids.

**permission** [string, optional] A permissions string, one of "read", "write", or "manage". Lists only projects for which the current user has that permission.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**archived** [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 1000.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### **Returns**

id [integer] The ID for this project.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of this project.

**description** [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto\_share [boolean]
created\_at [string/time]
updated\_at [string/time]
archived [string] The archival status of the requested item(s).

## list shares (id)

List users and groups permissioned on this object

```
id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  writers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]

                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
post (name, description, *, note='DEFAULT', hidden='DEFAULT')
      Create a project
            Parameters
                  name [string] The name of this project.
                  description [string] A description of the project.
                  note [string, optional] Notes for the project.
                  hidden [boolean, optional] The hidden status of the item.
            Returns
                  id [integer] The ID for this project.
                  author [dict::]
                            • id [integer] The ID of this user.
```

**Parameters** 

6.5. API Client 347

• username [string] This user's username.

• name [string] This user's name.

• initials [string] This user's initials.

```
• online [boolean] Whether this user is online. name [string] The name of this project. description [string] A description of the project. users [list::] Users who can see the project. - id: integer
```

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

#### **Queries**

```
class Queries (session_kwargs, return_type='civis')
      Methods
      delete runs (id, run id)
            Cancel a run
                  Parameters
                        id [integer] The ID of the query.
                        run_id [integer] The ID of the run.
                  Returns
                        None Response code 202: success
      get (id)
            Get details about a query
                  Parameters
                        id [integer] The query ID.
                  Returns
                        id [integer] The query ID.
                        database [integer] The database ID.
                        sql [string] The SQL to execute.
                        credential [integer] The credential ID.
                        result_rows [list] A preview of rows returned by the query.
                        result_columns [list] A preview of columns returned by the query.
                        script id [integer] The ID of the script associated with this query.
                        exception [string] Deprecated and not used.
                        error [string] The error message for this run, if present.
                        created_at [string/time]
                        updated_at [string/time]
                        finished_at [string/date-time] The end time of the last run.
                        state [string] The state of the last run.
                        last_run_id [integer] The ID of the last run.
                        hidden [boolean] The hidden status of the item.
                        name [string] The name of the query.
                        author [dict::]
                                  • id [integer] The ID of this user.
                                  • name [string] This user's name.
                                  • username [string] This user's username.
                                  • initials [string] This user's initials.
                                  • online [boolean] Whether this user is online.
                        started_at [string/date-time] The start time of the last run.
                        report_id [integer] The ID of the report associated with this query.
      get_runs (id, run_id)
            Check status of a run
                  Parameters
                        id [integer] The ID of the query.
```

run\_id [integer] The ID of the run.

### Returns

```
id [integer] The ID of the run.
```

**query\_id** [integer] The ID of the query.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

list (\*, database\_id='DEFAULT', author\_id='DEFAULT', created\_before='DEFAULT', exclude\_results='DEFAULT', hidden='DEFAULT', limit='DEFAULT', page\_num='DEFAULT',
 order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')
List

#### **Parameters**

database\_id [integer, optional] The database ID.

**author\_id** [integer, optional] The author of the query.

**created\_before** [string, optional] An upper bound for the creation date of the query.

exclude\_results [boolean, optional] If true, does not return cached query results.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to created at. Must be one of: created at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

#### Returns

id [integer] The query ID.

**database** [integer] The database ID.

sql [string] The SQL to execute.

credential [integer] The credential ID.

result\_rows [list] A preview of rows returned by the query.

result\_columns [list] A preview of columns returned by the query.

**script id** [integer] The ID of the script associated with this query.

**exception** [string] Deprecated and not used.

**error** [string] The error message for this run, if present.

created\_at [string/time]

updated\_at [string/time]

**finished\_at** [string/date-time] The end time of the last run.

**state** [string] The state of the last run.

last run id [integer] The ID of the last run.

**preview\_rows** [integer] The number of rows to save from the query's result (maximum: 100).

**started\_at** [string/date-time] The start time of the last run.

**report\_id** [integer] The ID of the report associated with this query.

list\_runs (id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')
List runs for the given query

#### **Parameters**

id [integer] The ID of the query.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

#### **Returns**

id [integer] The ID of the run.

query\_id [integer] The ID of the query.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

 $\textbf{list\_runs\_logs} (\textit{id}, \textit{run\_id}, *, \textit{last\_id='DEFAULT'}, \textit{limit='DEFAULT'})$ 

Get the logs for a run

#### **Parameters**

id [integer] The ID of the query.

run\_id [integer] The ID of the run.

last\_id [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

### Returns

id [integer] The ID of the log.

created\_at [string/date-time] The time the log was created.

message [string] The log message.

level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

post (database, sql, preview\_rows, \*, credential='DEFAULT', hidden='DEFAULT', in teractive='DEFAULT', include\_header='DEFAULT', compression='DEFAULT', col- umn\_delimiter='DEFAULT', unquoted='DEFAULT', filename\_prefix='DEFAULT') Execute a query

### **Parameters**

**database** [integer] The database ID.

sql [string] The SQL to execute.

**preview\_rows** [integer] The number of rows to save from the query's result (maximum: 100).

credential [integer, optional] The credential ID.

**hidden** [boolean, optional] The hidden status of the item.

**interactive** [boolean, optional] Deprecated and not used.

**include\_header** [boolean, optional] Whether the CSV output should include a header row [default: true].

**compression** [string, optional] The type of compression. One of gzip or zip, or none [default: gzip].

```
column delimiter [string, optional] The delimiter to use. One of comma or tab, or
                        pipe [default: comma].
                  unquoted [boolean, optional] If true, will not quote fields.
                  filename_prefix [string, optional] The output filename prefix.
            Returns
                  id [integer] The query ID.
                  database [integer] The database ID.
                  sql [string] The SQL to execute.
                  credential [integer] The credential ID.
                  result_rows [list] A preview of rows returned by the query.
                  result_columns [list] A preview of columns returned by the query.
                  script_id [integer] The ID of the script associated with this query.
                  exception [string] Deprecated and not used.
                  error [string] The error message for this run, if present.
                  created_at [string/time]
                  updated_at [string/time]
                  finished_at [string/date-time] The end time of the last run.
                  state [string] The state of the last run.
                  last run id [integer] The ID of the last run.
                  hidden [boolean] The hidden status of the item.
                  interactive [boolean] Deprecated and not used.
                  preview rows [integer] The number of rows to save from the query's result (maxi-
                        mum: 100).
                  include header [boolean] Whether the CSV output should include a header row [de-
                        fault: true1.
                  compression [string] The type of compression. One of gzip or zip, or none [default:
                        gzip].
                  column_delimiter [string] The delimiter to use. One of comma or tab, or pipe [de-
                        fault: comma].
                  unquoted [boolean] If true, will not quote fields.
                  filename_prefix [string] The output filename prefix.
                  started_at [string/date-time] The start time of the last run.
                  report_id [integer] The ID of the report associated with this query.
post_runs(id)
      Start a run
            Parameters
                  id [integer] The ID of the query.
            Returns
                  id [integer] The ID of the run.
                  query id [integer] The ID of the query.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                         'cancelled'.
                  is_cancel_requested [boolean] True if run cancel requested, else false.
                  started_at [string/time] The time the last run started at.
                  finished_at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
put_scripts (id, script_id)
      Update the query's associated script
            Parameters
                  id [integer] The query ID.
                  script_id [integer] The ID of the script associated with this query.
            Returns
                  id [integer] The query ID.
```

```
database [integer] The database ID.
                       sql [string] The SQL to execute.
                       credential [integer] The credential ID.
                       result_rows [list] A preview of rows returned by the query.
                       result columns [list] A preview of columns returned by the query.
                       script id [integer] The ID of the script associated with this query.
                       exception [string] Deprecated and not used.
                       error [string] The error message for this run, if present.
                       created at [string/time]
                       updated_at [string/time]
                       finished_at [string/date-time] The end time of the last run.
                       state [string] The state of the last run.
                       last_run_id [integer] The ID of the last run.
                       hidden [boolean] The hidden status of the item.
                       name [string] The name of the query.
                       author [dict::]
                                 • id [integer] The ID of this user.
                                 • name [string] This user's name.
                                 • username [string] This user's username.
                                 • initials [string] This user's initials.
                                 • online [boolean] Whether this user is online.
                       started at [string/date-time] The start time of the last run.
                       report id [integer] The ID of the report associated with this query.
civis.resources._resources.Remote_Hosts
     alias of civis.resources._resources.RemoteHosts
class Reports (session_kwargs, return_type='civis')
     delete_grants(id)
            Revoke permission for this report to perform Civis platform API operations on your behalf
                  Parameters
                       id [integer] The ID of this report.
                  Returns
                       None Response code 204: success
     delete projects (id, project id)
           Remove a Report from a project
```

Remote Hosts

**Methods** 

**Parameters** 

Returns

id [integer] The ID of the resource. **project id** [integer] The ID of the project.

Reports

```
None Response code 204: success
delete_services_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group id [integer] The ID of the group.
           Returns
                  None Response code 204: success
delete_services_shares_users (id, user_id)
      Revoke the permissions a user has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_id [integer] The ID of the user.
            Returns
                  None Response code 204: success
delete_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                  id [integer] The ID of the resource that is shared.
                  group_id [integer] The ID of the group.
            Returns
                  None Response code 204: success
delete_shares_users (id, user_id)
      Revoke the permissions a user has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_id [integer] The ID of the user.
            Returns
                  None Response code 204: success
get (id)
      Show a single report
            Parameters
                  id [integer] The ID of this report.
            Returns
                  id [integer] The ID of this report.
                  name [string] The name of the report.
                  user [dict::]
                           • id [integer] The ID of this user.
                           • name [string] This user's name.
                           • username [string] This user's username.
                           • initials [string] This user's initials.
                           • online [boolean] Whether this user is online.
                  created_at [string/time]
                  updated_at [string/time]
                  projects [list::] A list of projects containing the report. - id: integer
                             The ID for the project.
```

• name [string] The name of the project.

```
state [string] The status of the report's last run.
                  finished at [string/time] The time that the report's last run finished.
                  viz updated at [string/time] The time that the report's visualization was last updated.
                  script [dict::]
                             • id [integer] The ID for the script.
                             • name [string] The name of the script.
                             • sql [string] The raw SQL query for the script.
                  job_path [string] The link to details of the job that backs this report.
                  tableau_id [integer]
                  type [string]
                  template id [integer] The ID of the template used for this report.
                  auth_thumbnail_url [string] URL for a thumbnail of the report.
                  last run [dict::]
                             • id: integer
                             • state : string
                             • created at [string/time] The time that the run was queued.
                             • started at [string/time] The time that the run started.
                             • finished at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  archived [string] The archival status of the requested item(s).
                  hidden [boolean] The hidden status of the item.
                  auth data url [string]
                  auth_code_url [string]
                  config [string] Any configuration metadata for this report.
                  valid output file [boolean] Whether the job (a script or a query) that backs the report
                        currently has a valid output file.
                  provide_api_key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api_key [string] A Civis API key that can be used by this report.
                  api_key_id [integer] The ID of the API key. Can be used for auditing API use by this
                        report.
                  app state [dict] Any application state blob for this report.
                  use viewers tableau username [boolean] Apply user level filtering on Tableau re-
                        ports.
get_git_commits (id, commit_hash)
      Get file contents at commit hash
            Parameters
                  id [integer] The ID of the file.
                  commit_hash [string] The SHA (full or shortened) of the desired git commit.
                  content [string] The file's contents.
                  type [string] The file's type.
                  size [integer] The file's size.
                  file_hash [string] The SHA of the file.
get_services (id)
      Show a single service report
            Parameters
                  id [integer] The ID of this report.
```

#### Returns

```
id [integer] The ID of this report.name [string] The name of the report.user [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/time]

updated\_at [string/time]

**host** [string] The host for the service report

display\_url [string] The URL to display the service report.

service\_id [integer] The id of the backing service

provide\_api\_key [boolean] Whether the report requests an API Key from the report viewer.

api\_key [string] A Civis API key that can be used by this report.

api\_key\_id [integer] The ID of the API key. Can be used for auditing API use by this report.

#### **Parameters**

**type** [string, optional] If specified, return report of these types. It accepts a commaseparated list, possible values are 'tableau' or 'other'.

**author** [string, optional] If specified, return reports from this author. It accepts a comma-separated list of author ids.

**template\_id** [integer, optional] If specified, return reports using the provided Template.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**archived** [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

#### Returns

```
id [integer] The ID of this report.name [string] The name of the report.user [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.

- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/time]

updated\_at [string/time]

**projects** [list::] A list of projects containing the report. - id: integer

The ID for the project.

• name [string] The name of the project.

**state** [string] The status of the report's last run.

**finished\_at** [string/time] The time that the report's last run finished.

viz\_updated\_at [string/time] The time that the report's visualization was last updated.
script [dict::]

- id [integer] The ID for the script.
- name [string] The name of the script.
- sql [string] The raw SQL query for the script.

**job\_path** [string] The link to details of the job that backs this report.

tableau\_id [integer]

type [string]

template\_id [integer] The ID of the template used for this report.

auth thumbnail url [string] URL for a thumbnail of the report.

last run [dict::]

- id: integer
- state: string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**archived** [string] The archival status of the requested item(s).

## list\_git (id)

Get the git metadata attached to this Report

#### **Parameters**

id [integer] The ID of the file.

#### **Returns**

git\_ref [string] A git reference specifying an unambiguous version of the file. Can be a branch name, or the full or shortened SHA of a commit.

git\_branch [string] The git branch that the file is on.

**git\_path** [string] The path of the file in the repository.

git\_repo [dict::]

- id [integer] The ID for this git repository.
- repo\_url [string] The URL for this git repository.
- created\_at : string/time
- updated\_at : string/time

```
list_git_commits(id)
      Get the git commits for this Report
            Parameters
                  id [integer] The ID of the file.
            Returns
                  commit hash [string] The SHA of the commit.
                  author name [string] The name of the commit's author.
                  date [string/time] The commit's timestamp.
                  message [string] The commit message.
list_projects (id, *, hidden='DEFAULT')
      List the projects a Report belongs to
            Parameters
                  id [integer] The ID of the resource.
                  hidden [boolean, optional] If specified to be true, returns hidden items. Defaults to
                        false, returning non-hidden items.
            Returns
                  id [integer] The ID for this project.
                  author [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  name [string] The name of this project.
                  description [string] A description of the project.
                  users [list::] Users who can see the project. - id: integer
                              The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  auto_share [boolean]
                  created_at [string/time]
                  updated at [string/time]
                  archived [string] The archival status of the requested item(s).
list_services_shares(id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
```

```
- id: integer
                                      - name: string
                  writers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  owners [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name : string
                  total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
list\_shares(id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name : string
                  writers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  owners [dict::]
```

```
• users [list::]
                               - id : integer
                               - name: string
                      • groups [list::]
                               - id: integer
                               name : string
            total_user_shares [integer] For owners, the number of total users shared. For writers
                  and readers, the number of visible users shared.
            total_group_shares [integer] For owners, the number of total groups shared. For writ-
                  ers and readers, the number of visible groups shared.
Get details about the report's snapshot automation settings
            id [integer] The ID of this report.
            id [integer] The ID of this report.
            state [string] The status of the job's last run.
            finished_at [string/time] The time that the job's last run finished.
            send email on completion [boolean] Whether the job will send emails on comple-
                  tion.
            email template [string] Custom email template.
            recipient email addresses [string] Email addresses to send report to, comma sepa-
                  rated.
            email_subject [string] Subject for Email.
            height [integer] The height of the cropped snapshot image in screen pixels. The de-
                  fault value is 900 pixels. Minimum value is 600 pixels.
            width [integer] The width of the cropped snapshot image in screen pixels. The default
                  value is 1440 pixels. Minimum value is 600 pixels.
            schedule [dict::]
                      • scheduled [boolean] If the item is scheduled.
                      • scheduled days [list] Day based on numeric value starting at 0 for Sun-
                      • scheduled hours [list] Hours of the day it is scheduled on.
                      • scheduled minutes [list] Minutes of the day it is scheduled on.
                      • scheduled runs per hour [integer] Alternative to scheduled minutes,
                             number of times to run per hour.
            parent id [integer] The ID of the parent job that will trigger this snapshot.
              name='DEFAULT',
                                    script_id='DEFAULT',
                                                               code_body='DEFAULT',
                                                                                           con-
                                                      provide_api_key='DEFAULT',
                         app_state='DEFAULT',
                                                                                           tem-
  plate_id='DEFAULT', use_viewers_tableau_username='DEFAULT')
            id [integer] The ID of the report to modify.
```

list\_snapshots(id)

patch (id,

fig='DEFAULT',

**Parameters** 

Update a report

**Parameters** 

Returns

6.5. API Client 369

code\_body [string, optional] The code for the report visualization.

script\_id [integer, optional] The ID of the job (a script or a query) used to create this

**name** [string, optional] The name of the report.

config [string, optional]

```
app_state [dict, optional] The application state blob for this report.
```

provide\_api\_key [boolean, optional] Allow the report to provide an API key to frontend code.

**template\_id** [integer, optional] The ID of the template used for this report. If null is passed, no template will back this report. Changes to the backing template will reset the report appState.

**use\_viewers\_tableau\_username** [boolean, optional] Apply user level filtering on Tableau reports.

#### Returns

id [integer] The ID of this report.name [string] The name of the report.user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

```
created_at [string/time]
updated_at [string/time]
projects [list::] A list of projects containing the report. - id : integer
```

The ID for the project.

• name [string] The name of the project.

**state** [string] The status of the report's last run.

**finished\_at** [string/time] The time that the report's last run finished.

viz\_updated\_at [string/time] The time that the report's visualization was last updated.
script [dict::]

- id [integer] The ID for the script.
- name [string] The name of the script.
- sql [string] The raw SQL query for the script.

**job path** [string] The link to details of the job that backs this report.

tableau\_id [integer]

type [string]

**template id** [integer] The ID of the template used for this report.

auth\_thumbnail\_url [string] URL for a thumbnail of the report.

last run [dict::]

- id: integer
- state : string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**archived** [string] The archival status of the requested item(s).

hidden [boolean] The hidden status of the item.

auth\_data\_url [string]

auth code url [string]

```
valid output file [boolean] Whether the job (a script or a query) that backs the report
                        currently has a valid output file.
                  provide api key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api key [string] A Civis API key that can be used by this report.
                  api key id [integer] The ID of the API key. Can be used for auditing API use by this
                  app state [dict] Any application state blob for this report.
                  use_viewers_tableau_username [boolean] Apply user level filtering on Tableau re-
patch_services (id, *, name='DEFAULT', provide_api_key='DEFAULT')
      Update some attributes of this service report
            Parameters
                  id [integer] The ID of this report.
                  name [string, optional] The name of the service report.
                  provide_api_key [boolean, optional] Whether the report requests an API Key from
                        the report viewer.
            Returns
                  id [integer] The ID of this report.
                  name [string] The name of the report.
                  user [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  created_at [string/time]
                  updated_at [string/time]
                  host [string] The host for the service report
                  display_url [string] The URL to display the service report.
                  service id [integer] The id of the backing service
                  provide_api_key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api_key [string] A Civis API key that can be used by this report.
                  api key id [integer] The ID of the API key. Can be used for auditing API use by this
                        report.
                                                 state='DEFAULT'.
                                                                            finished at='DEFAULT',
patch snapshots (id,
                       send email on completion='DEFAULT',
                                                                        email template='DEFAULT'.
                                                                         email subject='DEFAULT'.
                       recipient_email_addresses='DEFAULT',
                       height='DEFAULT',
                                               width='DEFAULT',
                                                                      schedule='DEFAULT',
                       ent_id='DEFAULT')
     Update the report's snapshot automation settings
            Parameters
                  id [integer] The ID of this report.
                  state [string, optional] The status of the job's last run.
                  finished at [string/time, optional] The time that the job's last run finished.
                  send_email_on_completion [boolean, optional] Whether the job will send emails on
                        completion.
                  email_template [string, optional] Custom email template.
```

**config** [string] Any configuration metadata for this report.

email\_subject [string, optional] Subject for Email.

**height** [integer, optional] The height of the cropped snapshot image in screen pixels. The default value is 900 pixels. Minimum value is 600 pixels.

width [integer, optional] The width of the cropped snapshot image in screen pixels. The default value is 1440 pixels. Minimum value is 600 pixels.

**schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] The ID of the parent job that will trigger this snapshot.

**Returns**id [integer] The ID of this report.

state [string] The status of the job's last run.

**finished\_at** [string/time] The time that the job's last run finished.

**send\_email\_on\_completion** [boolean] Whether the job will send emails on completion.

email\_template [string] Custom email template.

**recipient\_email\_addresses** [string] Email addresses to send report to, comma separated.

email\_subject [string] Subject for Email.

**height** [integer] The height of the cropped snapshot image in screen pixels. The default value is 900 pixels. Minimum value is 600 pixels.

width [integer] The width of the cropped snapshot image in screen pixels. The default value is 1440 pixels. Minimum value is 600 pixels.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] The ID of the parent job that will trigger this snapshot.

#### **Parameters**

**script\_id** [integer, optional] The ID of the job (a script or a query) used to create this report.

**name** [string, optional] The name of the report.

**code\_body** [string, optional] The code for the report visualization.

app\_state [dict, optional] Any application state blob for this report.

```
provide api key [boolean, optional] Allow the report to provide an API key to front-
            end code.
      template id [integer, optional] The ID of the template used for this report.
      hidden [boolean, optional] The hidden status of the item.
Returns
      id [integer] The ID of this report.
      name [string] The name of the report.
      user [dict::]
                • id [integer] The ID of this user.
                • name [string] This user's name.
                • username [string] This user's username.
                • initials [string] This user's initials.
                • online [boolean] Whether this user is online.
      created_at [string/time]
      updated_at [string/time]
      projects [list::] A list of projects containing the report. - id: integer
                  The ID for the project.
                • name [string] The name of the project.
      state [string] The status of the report's last run.
      finished at [string/time] The time that the report's last run finished.
      viz updated at [string/time] The time that the report's visualization was last updated.
      script [dict::]
                • id [integer] The ID for the script.
                • name [string] The name of the script.
                • sql [string] The raw SQL query for the script.
      job_path [string] The link to details of the job that backs this report.
      tableau_id [integer]
      type [string]
      template id [integer] The ID of the template used for this report.
      auth thumbnail url [string] URL for a thumbnail of the report.
      last run [dict::]
                • id: integer
                • state: string
                • created at [string/time] The time that the run was queued.
                • started at [string/time] The time that the run started.
                • finished_at [string/time] The time that the run completed.
                • error [string] The error message for this run, if present.
      archived [string] The archival status of the requested item(s).
      hidden [boolean] The hidden status of the item.
      auth_data_url [string]
      auth_code_url [string]
      config [string] Any configuration metadata for this report.
      valid_output_file [boolean] Whether the job (a script or a query) that backs the report
            currently has a valid output file.
```

```
provide api key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api key [string] A Civis API key that can be used by this report.
                  api_key_id [integer] The ID of the API key. Can be used for auditing API use by this
                        report.
                  app state [dict] Any application state blob for this report.
                  use viewers tableau username [boolean] Apply user level filtering on Tableau re-
post_git_commits (id, content, message, file_hash)
      Commit and push a new version of the file
            Parameters
                  id [integer] The ID of the file.
                  content [string] The contents to commit to the file.
                  message [string] A commit message describing the changes being made.
                  file_hash [string] The full SHA of the file being replaced.
            Returns
                  content [string] The file's contents.
                  type [string] The file's type.
                  size [integer] The file's size.
                  file hash [string] The SHA of the file.
post_grants(id)
      Grant this report the ability to perform Civis platform API operations on your behalf
            Parameters
                  id [integer] The ID of this report.
            Returns
                  id [integer] The ID of this report.
                  name [string] The name of the report.
                  user [dict::]
                             • id [integer] The ID of this user.
                             • name [string] This user's name.
                             • username [string] This user's username.
                             • initials [string] This user's initials.
                             • online [boolean] Whether this user is online.
                  created at [string/time]
                  updated at [string/time]
                  projects [list::] A list of projects containing the report. - id: integer
                               The ID for the project.
                             • name [string] The name of the project.
                  state [string] The status of the report's last run.
                  finished_at [string/time] The time that the report's last run finished.
                  viz_updated_at [string/time] The time that the report's visualization was last updated.
                  script [dict::]
                             • id [integer] The ID for the script.
                             • name [string] The name of the script.
                             • sql [string] The raw SQL query for the script.
                  job path [string] The link to details of the job that backs this report.
                  tableau id [integer]
```

```
type [string]
                  template id [integer] The ID of the template used for this report.
                  auth thumbnail url [string] URL for a thumbnail of the report.
                  last run [dict::]
                            • id : integer
                            • state: string
                            • created at [string/time] The time that the run was queued.
                            • started_at [string/time] The time that the run started.
                            • finished_at [string/time] The time that the run completed.
                            • error [string] The error message for this run, if present.
                  archived [string] The archival status of the requested item(s).
                  hidden [boolean] The hidden status of the item.
                  auth_data_url [string]
                  auth_code_url [string]
                  config [string] Any configuration metadata for this report.
                  valid output file [boolean] Whether the job (a script or a query) that backs the report
                        currently has a valid output file.
                  provide_api_key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api_key [string] A Civis API key that can be used by this report.
                  api key id [integer] The ID of the API key. Can be used for auditing API use by this
                        report.
                  app state [dict] Any application state blob for this report.
                  use_viewers_tableau_username [boolean] Apply user level filtering on Tableau re-
                        ports.
post_services (service_id, *, provide_api_key='DEFAULT')
      Create a service report
            Parameters
                  service_id [integer] The id of the backing service
                  provide_api_key [boolean, optional] Whether the report requests an API Key from
                        the report viewer.
            Returns
                  id [integer] The ID of this report.
                  name [string] The name of the report.
                  user [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  created_at [string/time]
                  updated_at [string/time]
                  host [string] The host for the service report
                  display_url [string] The URL to display the service report.
                  service_id [integer] The id of the backing service
                  provide_api_key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api key [string] A Civis API key that can be used by this report.
```

api\_key\_id [integer] The ID of the API key. Can be used for auditing API use by this report.

Generate and optionally email a snapshot of the specified report

#### **Parameters**

id [integer] The ID of this report.

**state** [string, optional] The status of the job's last run.

finished\_at [string/time, optional] The time that the job's last run finished.

**send\_email\_on\_completion** [boolean, optional] Whether the job will send emails on completion.

email\_template [string, optional] Custom email template.

**recipient\_email\_addresses** [string, optional] Email addresses to send report to, comma separated.

email\_subject [string, optional] Subject for Email.

**height** [integer, optional] The height of the cropped snapshot image in screen pixels. The default value is 900 pixels. Minimum value is 600 pixels.

width [integer, optional] The width of the cropped snapshot image in screen pixels. The default value is 1440 pixels. Minimum value is 600 pixels.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- **scheduled\_hours** [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] The ID of the parent job that will trigger this snapshot.

## Returns

id [integer] The ID of this report.

state [string] The status of the job's last run.

**finished at** [string/time] The time that the job's last run finished.

**send\_email\_on\_completion** [boolean] Whether the job will send emails on completion.

**email template** [string] Custom email template.

**recipient\_email\_addresses** [string] Email addresses to send report to, comma separated.

email\_subject [string] Subject for Email.

**height** [integer] The height of the cropped snapshot image in screen pixels. The default value is 900 pixels. Minimum value is 600 pixels.

width [integer] The width of the cropped snapshot image in screen pixels. The default value is 1440 pixels. Minimum value is 600 pixels.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.

```
• scheduled_minutes [list] Minutes of the day it is scheduled on.
```

• **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] The ID of the parent job that will trigger this snapshot.

```
put_archive (id, status)
```

Update the archive status of this object

#### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

#### Returns

id [integer] The ID of this report.name [string] The name of the report.user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/time]

updated\_at [string/time]

**projects** [list::] A list of projects containing the report. - id: integer

The ID for the project.

• name [string] The name of the project.

**state** [string] The status of the report's last run.

finished\_at [string/time] The time that the report's last run finished.

viz\_updated\_at [string/time] The time that the report's visualization was last updated.
script [dict::]

- id [integer] The ID for the script.
- name [string] The name of the script.
- sql [string] The raw SQL query for the script.

**job\_path** [string] The link to details of the job that backs this report.

tableau\_id [integer]

type [string]

**template id** [integer] The ID of the template used for this report.

auth\_thumbnail\_url [string] URL for a thumbnail of the report.

last\_run [dict::]

- id: integer
- state : string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

**archived** [string] The archival status of the requested item(s).

hidden [boolean] The hidden status of the item.

```
auth data url [string]
                  auth code url [string]
                  config [string] Any configuration metadata for this report.
                  valid_output_file [boolean] Whether the job (a script or a query) that backs the report
                        currently has a valid output file.
                  provide api key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api key [string] A Civis API key that can be used by this report.
                  api key id [integer] The ID of the API key. Can be used for auditing API use by this
                  app_state [dict] Any application state blob for this report.
                  use_viewers_tableau_username [boolean] Apply user level filtering on Tableau re-
put_git (id,
                          git_ref='DEFAULT',
                                                  git branch='DEFAULT',
                                                                                git_path='DEFAULT',
           git_repo_url='DEFAULT')
      Attach this Report to a git repo/file
            Parameters
                  id [integer] The ID of the file.
                  git_ref [string, optional] A git reference specifying an unambiguous version of the
                        file. Can be a branch name, or the full or shortened SHA of a commit.
                  git branch [string, optional] The git branch that the file is on.
                  git_path [string, optional] The path of the file in the repository.
                  git repo url [string, optional] The URL of the git repository.
            Returns
                  git ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git branch [string] The git branch that the file is on.
                  git_path [string] The path of the file in the repository.
                  git_repo [dict::]
                            • id [integer] The ID for this git repository.
                            • repo_url [string] The URL for this git repository.
                            created_at : string/time
                            • updated_at : string/time
put_projects (id, project_id)
      Add a Report to a project
            Parameters
                  id [integer] The ID of the resource.
                  project id [integer] The ID of the project.
            Returns
                  None Response code 204: success
                                                                                     permission level.
put services shares groups (id,
                                                          group_ids,
                                                                      share_email_body='DEFAULT',
                                       send shared_email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share email body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
```

```
readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name : string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name : string
                            • groups [list::]
                                     - id: integer
                                      - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put services shares users (id,
                                                          user ids,
                                                                                     permission level,
                                                                      share_email_body='DEFAULT',
                                     send shared email='DEFAULT')
     Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share email body [string, optional] Custom body text for e-mail sent on a share.
                  send shared email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
```

```
- name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total group shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
                               group_ids, permission_level,
                                                                *, share_email_body='DEFAULT',
put_shares_groups (id,
                          send_shared_email='DEFAULT')
     Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string

                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                      name : string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put_shares_users (id,
                                           permission_level,
                                                                      share_email_body='DEFAULT',
                               user_ids,
                        send_shared_email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                      - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
```

```
name : string
```

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

### Results

```
class Results (session_kwargs, return_type='civis')
```

#### **Methods**

# delete\_grants(id)

Revoke permission for this report to perform Civis platform API operations on your behalf

#### **Parameters**

id [integer] The ID of this report.

#### **Returns**

None Response code 204: success

### delete\_projects (id, project\_id)

Remove a Report from a project

### **Parameters**

id [integer] The ID of the resource.

project\_id [integer] The ID of the project.

#### Returns

None Response code 204: success

### delete\_services\_shares\_groups (id, group\_id)

Revoke the permissions a group has on this object

### **Parameters**

**id** [integer] The ID of the resource that is shared.

**group\_id** [integer] The ID of the group.

#### Returns

None Response code 204: success

### delete\_services\_shares\_users (id, user\_id)

Revoke the permissions a user has on this object

### **Parameters**

id [integer] The ID of the resource that is shared.

user\_id [integer] The ID of the user.

### Returns

None Response code 204: success

# ${\tt delete\_shares\_groups}\ (id, \textit{group\_id})$

Revoke the permissions a group has on this object

### **Parameters**

id [integer] The ID of the resource that is shared.

group\_id [integer] The ID of the group.

### Returns

None Response code 204: success

### delete\_shares\_users (id, user\_id)

Revoke the permissions a user has on this object

```
Parameters
                  id [integer] The ID of the resource that is shared.
                  user id [integer] The ID of the user.
            Returns
                  None Response code 204: success
get (id)
      Show a single report
            Parameters
                  id [integer] The ID of this report.
            Returns
                  id [integer] The ID of this report.
                  name [string] The name of the report.
                  user [dict::]
                             • id [integer] The ID of this user.
                             • name [string] This user's name.
                             • username [string] This user's username.
                             • initials [string] This user's initials.
                             • online [boolean] Whether this user is online.
                  created at [string/time]
                  updated_at [string/time]
                  projects [list::] A list of projects containing the report. - id: integer
                               The ID for the project.
                             • name [string] The name of the project.
                  state [string] The status of the report's last run.
                  finished at [string/time] The time that the report's last run finished.
                  viz_updated_at [string/time] The time that the report's visualization was last updated.
                  script [dict::]
                             • id [integer] The ID for the script.
                             • name [string] The name of the script.
                             • sql [string] The raw SQL query for the script.
                  job path [string] The link to details of the job that backs this report.
                  tableau_id [integer]
                  type [string]
                  template id [integer] The ID of the template used for this report.
                  auth thumbnail url [string] URL for a thumbnail of the report.
                  last run [dict::]
                             • id: integer
                             • state: string
                             • created_at [string/time] The time that the run was queued.
                             • started_at [string/time] The time that the run started.
                             • finished_at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  archived [string] The archival status of the requested item(s).
```

hidden [boolean] The hidden status of the item.

```
auth data url [string]
                  auth code url [string]
                  config [string] Any configuration metadata for this report.
                  valid_output_file [boolean] Whether the job (a script or a query) that backs the report
                        currently has a valid output file.
                  provide api key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api key [string] A Civis API key that can be used by this report.
                  api key id [integer] The ID of the API key. Can be used for auditing API use by this
                  app_state [dict] Any application state blob for this report.
                  use_viewers_tableau_username [boolean] Apply user level filtering on Tableau re-
get_git_commits (id, commit_hash)
      Get file contents at commit_hash
            Parameters
                  id [integer] The ID of the file.
                  commit hash [string] The SHA (full or shortened) of the desired git commit.
            Returns
                  content [string] The file's contents.
                  type [string] The file's type.
                  size [integer] The file's size.
                  file hash [string] The SHA of the file.
get_services (id)
      Show a single service report
            Parameters
                  id [integer] The ID of this report.
            Returns
                  id [integer] The ID of this report.
                  name [string] The name of the report.
                  user [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  created at [string/time]
                  updated at [string/time]
                  host [string] The host for the service report
                  display_url [string] The URL to display the service report.
                  service_id [integer] The id of the backing service
                  provide_api_key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api_key [string] A Civis API key that can be used by this report.
                  api_key_id [integer] The ID of the API key. Can be used for auditing API use by this
                        report.
list(*, type='DEFAULT', author='DEFAULT', template_id='DEFAULT', hidden='DEFAULT',
       archived='DEFAULT', limit='DEFAULT', page_num='DEFAULT', order='DEFAULT', or-
       der dir='DEFAULT', iterator='DEFAULT')
     List
```

#### **Parameters**

**type** [string, optional] If specified, return report of these types. It accepts a commaseparated list, possible values are 'tableau' or 'other'.

**author** [string, optional] If specified, return reports from this author. It accepts a comma-separated list of author ids.

**template\_id** [integer, optional] If specified, return reports using the provided Template.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**archived** [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The ID of this report.name [string] The name of the report.user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/time]
updated\_at [string/time]

projects [list::] A list of projects containing the report. - id: integer

The ID for the project.

• name [string] The name of the project.

**state** [string] The status of the report's last run.

**finished at** [string/time] The time that the report's last run finished.

viz\_updated\_at [string/time] The time that the report's visualization was last updated.
script [dict::]

- id [integer] The ID for the script.
- name [string] The name of the script.
- sql [string] The raw SQL query for the script.

**job\_path** [string] The link to details of the job that backs this report.

tableau\_id [integer]

type [string]

**template id** [integer] The ID of the template used for this report.

auth thumbnail url [string] URL for a thumbnail of the report.

last run [dict::]

- id: integer
- state: string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**archived** [string] The archival status of the requested item(s).

### list\_git (id)

Get the git metadata attached to this Report

#### **Parameters**

id [integer] The ID of the file.

#### Returns

**git\_ref** [string] A git reference specifying an unambiguous version of the file. Can be a branch name, or the full or shortened SHA of a commit.

git branch [string] The git branch that the file is on.

git\_path [string] The path of the file in the repository.

git\_repo [dict::]

- id [integer] The ID for this git repository.
- repo\_url [string] The URL for this git repository.
- created at : string/time
- updated at : string/time

### list\_git\_commits(id)

Get the git commits for this Report

### **Parameters**

id [integer] The ID of the file.

#### Returns

commit\_hash [string] The SHA of the commit.

author\_name [string] The name of the commit's author.

date [string/time] The commit's timestamp.

message [string] The commit message.

## list\_projects (id, \*, hidden='DEFAULT')

List the projects a Report belongs to

### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

### Returns

id [integer] The ID for this project.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of this project.

```
users [list::] Users who can see the project. - id : integer
                              The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  auto_share [boolean]
                  created at [string/time]
                  updated_at [string/time]
                  archived [string] The archival status of the requested item(s).
list_services_shares (id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name : string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  writers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  owners [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
```

**description** [string] A description of the project.

```
list shares (id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  writers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name : string
                  owners [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      – name : string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
list snapshots (id)
      Get details about the report's snapshot automation settings
            Parameters
                  id [integer] The ID of this report.
            Returns
                  id [integer] The ID of this report.
                  state [string] The status of the job's last run.
                  finished_at [string/time] The time that the job's last run finished.
                  send_email_on_completion [boolean] Whether the job will send emails on comple-
                        tion.
                  email_template [string] Custom email template.
                  recipient_email_addresses [string] Email addresses to send report to, comma sepa-
                        rated.
                  email_subject [string] Subject for Email.
```

**height** [integer] The height of the cropped snapshot image in screen pixels. The default value is 900 pixels. Minimum value is 600 pixels.

width [integer] The width of the cropped snapshot image in screen pixels. The default value is 1440 pixels. Minimum value is 600 pixels.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] The ID of the parent job that will trigger this snapshot.

```
patch (id, *, name='DEFAULT', script_id='DEFAULT', code_body='DEFAULT', con-
fig='DEFAULT', app_state='DEFAULT', provide_api_key='DEFAULT', tem-
plate_id='DEFAULT', use_viewers_tableau_username='DEFAULT')
Update a report
```

#### **Parameters**

id [integer] The ID of the report to modify.

**name** [string, optional] The name of the report.

script\_id [integer, optional] The ID of the job (a script or a query) used to create this
report.

**code body** [string, optional] The code for the report visualization.

**config** [string, optional]

**app state** [dict, optional] The application state blob for this report.

**provide\_api\_key** [boolean, optional] Allow the report to provide an API key to frontend code.

**template\_id** [integer, optional] The ID of the template used for this report. If null is passed, no template will back this report. Changes to the backing template will reset the report appState.

**use\_viewers\_tableau\_username** [boolean, optional] Apply user level filtering on Tableau reports.

### Returns

```
id [integer] The ID of this report.name [string] The name of the report.user [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/time]

updated\_at [string/time]

projects [list::] A list of projects containing the report. - id: integer

The ID for the project.

• name [string] The name of the project.

**state** [string] The status of the report's last run.

```
finished at [string/time] The time that the report's last run finished.
                  viz updated at [string/time] The time that the report's visualization was last updated.
                  script [dict::]
                            • id [integer] The ID for the script.
                            • name [string] The name of the script.
                            • sql [string] The raw SQL query for the script.
                  job path [string] The link to details of the job that backs this report.
                  tableau id [integer]
                  type [string]
                  template_id [integer] The ID of the template used for this report.
                  auth_thumbnail_url [string] URL for a thumbnail of the report.
                  last_run [dict::]
                            • id: integer
                            · state: string
                            • created at [string/time] The time that the run was queued.
                            • started at [string/time] The time that the run started.
                            • finished_at [string/time] The time that the run completed.
                            • error [string] The error message for this run, if present.
                  archived [string] The archival status of the requested item(s).
                  hidden [boolean] The hidden status of the item.
                  auth data url [string]
                  auth_code_url [string]
                  config [string] Any configuration metadata for this report.
                  valid_output_file [boolean] Whether the job (a script or a query) that backs the report
                        currently has a valid output file.
                  provide_api_key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api_key [string] A Civis API key that can be used by this report.
                  api_key_id [integer] The ID of the API key. Can be used for auditing API use by this
                  app state [dict] Any application state blob for this report.
                  use viewers tableau username [boolean] Apply user level filtering on Tableau re-
patch_services (id, *, name='DEFAULT', provide_api_key='DEFAULT')
      Update some attributes of this service report
            Parameters
                  id [integer] The ID of this report.
                  name [string, optional] The name of the service report.
                  provide_api_key [boolean, optional] Whether the report requests an API Key from
                        the report viewer.
            Returns
                  id [integer] The ID of this report.
                  name [string] The name of the report.
                  user [dict::]
                            • id [integer] The ID of this user.
```

• name [string] This user's name.

• username [string] This user's username.

```
• initials [string] This user's initials.
```

• online [boolean] Whether this user is online.

created at [string/time]

updated\_at [string/time]

host [string] The host for the service report

**display url** [string] The URL to display the service report.

**service\_id** [integer] The id of the backing service

provide\_api\_key [boolean] Whether the report requests an API Key from the report viewer.

api\_key [string] A Civis API key that can be used by this report.

api\_key\_id [integer] The ID of the API key. Can be used for auditing API use by this report.

#### 

Update the report's snapshot automation settings

### **Parameters**

id [integer] The ID of this report.

**state** [string, optional] The status of the job's last run.

**finished\_at** [string/time, optional] The time that the job's last run finished.

**send\_email\_on\_completion** [boolean, optional] Whether the job will send emails on completion.

email\_template [string, optional] Custom email template.

**recipient\_email\_addresses** [string, optional] Email addresses to send report to, comma separated.

email\_subject [string, optional] Subject for Email.

**height** [integer, optional] The height of the cropped snapshot image in screen pixels. The default value is 900 pixels. Minimum value is 600 pixels.

width [integer, optional] The width of the cropped snapshot image in screen pixels. The default value is 1440 pixels. Minimum value is 600 pixels.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] The ID of the parent job that will trigger this snapshot.

# Returns

id [integer] The ID of this report.

state [string] The status of the job's last run.

**finished\_at** [string/time] The time that the job's last run finished.

**send\_email\_on\_completion** [boolean] Whether the job will send emails on completion.

email\_template [string] Custom email template.

**recipient\_email\_addresses** [string] Email addresses to send report to, comma separated.

email\_subject [string] Subject for Email.

**height** [integer] The height of the cropped snapshot image in screen pixels. The default value is 900 pixels. Minimum value is 600 pixels.

width [integer] The width of the cropped snapshot image in screen pixels. The default value is 1440 pixels. Minimum value is 600 pixels.

schedule [dict::]

- **scheduled** [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] The ID of the parent job that will trigger this snapshot.

#### **Parameters**

**script\_id** [integer, optional] The ID of the job (a script or a query) used to create this report.

**name** [string, optional] The name of the report.

**code body** [string, optional] The code for the report visualization.

app\_state [dict, optional] Any application state blob for this report.

provide\_api\_key [boolean, optional] Allow the report to provide an API key to frontend code.

**template id** [integer, optional] The ID of the template used for this report.

hidden [boolean, optional] The hidden status of the item.

### Returns

id [integer] The ID of this report.name [string] The name of the report.user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/time]

updated at [string/time]

**projects** [list::] A list of projects containing the report. - id: integer

The ID for the project.

• name [string] The name of the project.

**state** [string] The status of the report's last run.

**finished\_at** [string/time] The time that the report's last run finished.

viz\_updated\_at [string/time] The time that the report's visualization was last updated.
script [dict::]

- id [integer] The ID for the script.
- name [string] The name of the script.

```
• sql [string] The raw SQL query for the script.
                  job path [string] The link to details of the job that backs this report.
                  tableau id [integer]
                  type [string]
                  template id [integer] The ID of the template used for this report.
                  auth thumbnail url [string] URL for a thumbnail of the report.
                  last run [dict::]
                             • id: integer
                             • state : string
                             • created_at [string/time] The time that the run was queued.
                             • started_at [string/time] The time that the run started.
                             • finished_at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  archived [string] The archival status of the requested item(s).
                  hidden [boolean] The hidden status of the item.
                  auth data url [string]
                  auth code url [string]
                  config [string] Any configuration metadata for this report.
                  valid output file [boolean] Whether the job (a script or a query) that backs the report
                        currently has a valid output file.
                  provide api key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api key [string] A Civis API key that can be used by this report.
                  api_key_id [integer] The ID of the API key. Can be used for auditing API use by this
                        report.
                  app_state [dict] Any application state blob for this report.
                  use_viewers_tableau_username [boolean] Apply user level filtering on Tableau re-
                        ports.
post_git_commits (id, content, message, file_hash)
      Commit and push a new version of the file
            Parameters
                  id [integer] The ID of the file.
                  content [string] The contents to commit to the file.
                  message [string] A commit message describing the changes being made.
                  file_hash [string] The full SHA of the file being replaced.
            Returns
                  content [string] The file's contents.
                  type [string] The file's type.
                  size [integer] The file's size.
                  file_hash [string] The SHA of the file.
post_grants (id)
      Grant this report the ability to perform Civis platform API operations on your behalf
            Parameters
                  id [integer] The ID of this report.
            Returns
                  id [integer] The ID of this report.
                  name [string] The name of the report.
                  user [dict::]
                             • id [integer] The ID of this user.
```

```
• name [string] This user's name.
          • username [string] This user's username.
          • initials [string] This user's initials.
          • online [boolean] Whether this user is online.
created at [string/time]
updated at [string/time]
projects [list::] A list of projects containing the report. - id: integer
            The ID for the project.
          • name [string] The name of the project.
state [string] The status of the report's last run.
finished at [string/time] The time that the report's last run finished.
viz_updated_at [string/time] The time that the report's visualization was last updated.
script [dict::]
          • id [integer] The ID for the script.
          • name [string] The name of the script.
          • sql [string] The raw SQL query for the script.
job path [string] The link to details of the job that backs this report.
tableau_id [integer]
type [string]
template id [integer] The ID of the template used for this report.
auth thumbnail url [string] URL for a thumbnail of the report.
last_run [dict::]
          • id: integer
          • state: string
          • created_at [string/time] The time that the run was queued.
          • started_at [string/time] The time that the run started.
          • finished_at [string/time] The time that the run completed.
          • error [string] The error message for this run, if present.
archived [string] The archival status of the requested item(s).
hidden [boolean] The hidden status of the item.
auth data url [string]
auth_code_url [string]
```

**config** [string] Any configuration metadata for this report. valid output file [boolean] Whether the job (a script or a query) that backs the report

currently has a valid output file.

provide\_api\_key [boolean] Whether the report requests an API Key from the report

api\_key [string] A Civis API key that can be used by this report.

api\_key\_id [integer] The ID of the API key. Can be used for auditing API use by this

**app\_state** [dict] Any application state blob for this report.

use\_viewers\_tableau\_username [boolean] Apply user level filtering on Tableau reports.

post services (service id, \*, provide api key='DEFAULT') Create a service report

#### **Parameters**

service\_id [integer] The id of the backing service
provide\_api\_key [boolean, optional] Whether the report requests an API Key from
the report viewer.

#### Returns

id [integer] The ID of this report.name [string] The name of the report.user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/time]
updated\_at [string/time]

**host** [string] The host for the service report

**display url** [string] The URL to display the service report.

service\_id [integer] The id of the backing service

provide\_api\_key [boolean] Whether the report requests an API Key from the report viewer.

api\_key [string] A Civis API key that can be used by this report.

api\_key\_id [integer] The ID of the API key. Can be used for auditing API use by this report.

Generate and optionally email a snapshot of the specified report

### **Parameters**

id [integer] The ID of this report.

**state** [string, optional] The status of the job's last run.

**finished\_at** [string/time, optional] The time that the job's last run finished.

**send\_email\_on\_completion** [boolean, optional] Whether the job will send emails on completion.

**email template** [string, optional] Custom email template.

recipient\_email\_addresses [string, optional] Email addresses to send report to, comma separated.

email\_subject [string, optional] Subject for Email.

**height** [integer, optional] The height of the cropped snapshot image in screen pixels. The default value is 900 pixels. Minimum value is 600 pixels.

width [integer, optional] The width of the cropped snapshot image in screen pixels. The default value is 1440 pixels. Minimum value is 600 pixels.

**schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.

• **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer, optional] The ID of the parent job that will trigger this snapshot.

### Returns

id [integer] The ID of this report.

state [string] The status of the job's last run.

**finished at** [string/time] The time that the job's last run finished.

send\_email\_on\_completion [boolean] Whether the job will send emails on completion.

email\_template [string] Custom email template.

**recipient\_email\_addresses** [string] Email addresses to send report to, comma separated.

email\_subject [string] Subject for Email.

**height** [integer] The height of the cropped snapshot image in screen pixels. The default value is 900 pixels. Minimum value is 600 pixels.

width [integer] The width of the cropped snapshot image in screen pixels. The default value is 1440 pixels. Minimum value is 600 pixels.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

parent\_id [integer] The ID of the parent job that will trigger this snapshot.

# put\_archive (id, status)

Update the archive status of this object

#### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

# Returns

id [integer] The ID of this report.name [string] The name of the report.user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

created\_at [string/time]

updated\_at [string/time]

**projects** [list::] A list of projects containing the report. - id: integer

The ID for the project.

• name [string] The name of the project.

**state** [string] The status of the report's last run.

```
viz updated at [string/time] The time that the report's visualization was last updated.
                  script [dict::]
                             • id [integer] The ID for the script.
                             • name [string] The name of the script.
                             • sql [string] The raw SQL query for the script.
                  job path [string] The link to details of the job that backs this report.
                  tableau id [integer]
                  type [string]
                  template_id [integer] The ID of the template used for this report.
                  auth thumbnail url [string] URL for a thumbnail of the report.
                  last run [dict::]
                             • id: integer

                             • created at [string/time] The time that the run was queued.
                             • started at [string/time] The time that the run started.
                             • finished at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  archived [string] The archival status of the requested item(s).
                  hidden [boolean] The hidden status of the item.
                  auth data url [string]
                  auth_code_url [string]
                  config [string] Any configuration metadata for this report.
                  valid_output_file [boolean] Whether the job (a script or a query) that backs the report
                        currently has a valid output file.
                  provide api key [boolean] Whether the report requests an API Key from the report
                        viewer.
                  api_key [string] A Civis API key that can be used by this report.
                  api_key_id [integer] The ID of the API key. Can be used for auditing API use by this
                        report.
                  app state [dict] Any application state blob for this report.
                  use viewers tableau username [boolean] Apply user level filtering on Tableau re-
put_git (id,
                          git ref='DEFAULT',
                                                    git branch='DEFAULT',
                                                                                 git path='DEFAULT',
           git_repo_url='DEFAULT')
      Attach this Report to a git repo/file
            Parameters
                  id [integer] The ID of the file.
                  git ref [string, optional] A git reference specifying an unambiguous version of the
                        file. Can be a branch name, or the full or shortened SHA of a commit.
                  git_branch [string, optional] The git branch that the file is on.
                  git_path [string, optional] The path of the file in the repository.
                  git_repo_url [string, optional] The URL of the git repository.
            Returns
                  git ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git branch [string] The git branch that the file is on.
                  git_path [string] The path of the file in the repository.
                  git_repo [dict::]
```

**finished at** [string/time] The time that the report's last run finished.

```
• id [integer] The ID for this git repository.
                            • repo_url [string] The URL for this git repository.
                            • created_at : string/time
                            • updated_at : string/time
put_projects (id, project_id)
      Add a Report to a project
            Parameters
                  id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_services_shares_groups (id,
                                                         group_ids,
                                                                                    permission_level,
                                                                     share_email_body='DEFAULT',
                                       send_shared_email='DEFAULT')
     Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share email body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer

                       total_user_shares [integer] For owners, the number of total users shared. For writers
                             and readers, the number of visible users shared.
                       total_group_shares [integer] For owners, the number of total groups shared. For writ-
                             ers and readers, the number of visible groups shared.
class Scripts (session_kwargs, return_type='civis')
     delete_containers_projects (id, project_id)
           Remove a container docker from a project
                 Parameters
                       id [integer] The ID of the resource.
                       project_id [integer] The ID of the project.
                  Returns
                       None Response code 204: success
     delete_containers_runs (id, run_id)
           Cancel a run
                 Parameters
                       id [integer] The ID of the container.
                       run_id [integer] The ID of the run.
```

**Scripts** 

**Methods** 

Returns

None Response code 202: success

```
delete_containers_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete_containers_shares_users (id, user_id)
     Revoke the permissions a user has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 user_id [integer] The ID of the user.
           Returns
                 None Response code 204: success
delete_custom_projects(id, project_id)
     Remove a Job from a project
           Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
           Returns
                 None Response code 204: success
delete_custom_runs (id, run_id)
     Cancel a run
           Parameters
                 id [integer] The ID of the custom.
                 run_id [integer] The ID of the run.
           Returns
                 None Response code 202: success
delete_custom_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group_id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete_custom_shares_users (id, user_id)
     Revoke the permissions a user has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 user_id [integer] The ID of the user.
                 None Response code 204: success
delete_javascript_projects(id, project_id)
     Remove a scripted sql from a project
           Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
           Returns
                 None Response code 204: success
```

```
delete_javascript_runs(id, run_id)
     Cancel a run
           Parameters
                 id [integer] The ID of the javascript.
                 run_id [integer] The ID of the run.
           Returns
                 None Response code 202: success
delete_javascript_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group_id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete_javascript_shares_users (id, user_id)
     Revoke the permissions a user has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 user id [integer] The ID of the user.
           Returns
                 None Response code 204: success
delete python3 projects (id, project id)
     Remove a python docker from a project
           Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
           Returns
                 None Response code 204: success
delete_python3_runs(id, run_id)
     Cancel a run
           Parameters
                 id [integer] The ID of the python.
                 run_id [integer] The ID of the run.
           Returns
                 None Response code 202: success
delete_python3_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete_python3_shares_users (id, user_id)
     Revoke the permissions a user has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 user_id [integer] The ID of the user.
           Returns
                 None Response code 204: success
delete_r_projects (id, project_id)
```

Remove a r docker from a project

```
Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
           Returns
                 None Response code 204: success
delete_r_runs (id, run_id)
     Cancel a run
           Parameters
                 id [integer] The ID of the r.
                 run_id [integer] The ID of the run.
           Returns
                 None Response code 202: success
delete_r_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group_id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete_r_shares_users (id, user_id)
     Revoke the permissions a user has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 user_id [integer] The ID of the user.
           Returns
                 None Response code 204: success
delete_sql_projects (id, project_id)
     Remove a scripts from a project
           Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
           Returns
                 None Response code 204: success
delete_sql_runs (id, run_id)
     Cancel a run
           Parameters
                 id [integer] The ID of the sql.
                 run id [integer] The ID of the run.
           Returns
                 None Response code 202: success
delete_sql_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group_id [integer] The ID of the group.
           Returns
                 None Response code 204: success
delete sql shares users (id, user id)
     Revoke the permissions a user has on this object
```

#### **Parameters**

id [integer] The ID of the resource that is shared.

user\_id [integer] The ID of the user.

#### Returns

None Response code 204: success

get (id)

Get details about a script

#### **Parameters**

id [integer] The ID for the script.

#### Returns

id [integer] The ID for the script.name [string] The name of the script.

**type** [string] The type of script.

**created\_at** [string/time] The time this script was created.

**updated\_at** [string/time] The time this script was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.- name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's

or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.

• allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on. running as [dict::]
  - id [integer] The ID of this user.

```
• name [string] This user's name.
```

- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next\_run\_at** [string/time] The time of the next scheduled run.

**time zone** [string] The time zone of this script.

last run [dict::]

- id: integer
- · state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

sql [string] The raw SQL query for the script.

**expanded\_arguments** [dict] Expanded arguments for use in injecting into different environments.

**template script id** [integer] The ID of the template script, if any.

# get\_containers(id)

View a container

### **Parameters**

id [integer] The ID for the script.

### Returns

id [integer] The ID for the script.

**name** [string] The name of the container.

**type** [string] The type of the script (e.g Container)

created\_at [string/time] The time this script was created.

**updated\_at** [string/time] The time the script was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

finished\_at [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

template\_script\_name [string] The name of the template script.

links [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success email subject [string] Custom subject line for success e-mail.

- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

### required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB).
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.
- **repo\_http\_uri** [string] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.
- **repo\_ref** [string] The tag or branch of the github repo to clone into the container.
- **remote\_host\_credential\_id** [integer] The id of the database credentials to pass into the environment of the container.
- git\_credential\_id [integer] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.
- **docker\_command** [string] The command to run on the container. Will be run via sh as: ["sh", "-c", dockerCommand].
- docker\_image\_name [string] The name of the docker image to pull from DockerHub.
  docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).
- **instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.
- **cancel\_timeout** [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal.

```
If the script is still running after the timeout, it is sent a KILL signal. Defaults to
                         0.
                   last run [dict::]
                             • id: integer
                             • state: string
                             • created at [string/time] The time that the run was queued.
                             • started at [string/time] The time that the run started.
                             • finished_at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                   time zone [string] The time zone of this script.
                   hidden [boolean] The hidden status of the item.
                   archived [string] The archival status of the requested item(s).
                   target_project_id [integer] Target project to which script outputs will be added.
get_containers_runs (id, run_id)
      Check status of a run
            Parameters
                   id [integer] The ID of the container.
                   run_id [integer] The ID of the run.
            Returns
                   id [integer] The ID of the run.
                   container id [integer] The ID of the container.
                   state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                         'cancelled'.
                   is_cancel_requested [boolean] True if run cancel requested, else false.
                   started_at [string/time] The time the last run started at.
                   finished at [string/time] The time the last run completed.
                   error [string] The error, if any, returned by the run.
\mathtt{get\_custom}(id)
      Get a Custom Script
            Parameters
                   id [integer]
            Returns
                   id [integer] The ID for the script.
                   name [string] The name of the script.
                   type [string] The type of the script (e.g Custom)
                   created_at [string/time] The time this script was created.
                   updated at [string/time] The time the script was last updated.
                   author [dict::]
                             • id [integer] The ID of this user.
                             • name [string] This user's name.
                             • username [string] This user's username.
                             • initials [string] This user's initials.
                             • online [boolean] Whether this user is online.
                   state [string] The status of the script's last run.
                   finished_at [string/time] The time that the script's last run finished.
                   category [string]
                   projects [list::] A list of projects containing the script. - id: integer
```

The ID for the project.

• name [string] The name of the project.

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

ui report url [integer] The url of the custom HTML.

**ui report id** [integer] The id of the report with the custom HTML.

ui\_report\_provide\_api\_key [boolean] Whether the ui report requests an API Key
from the report viewer.

template\_script\_name [string] The name of the template script.

**template note** [string] The template's note.

**remote host id** [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

time zone [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

target\_project\_id [integer] Target project to which script outputs will be added.

```
\verb"get_custom_runs"\,(id,\,run\_id)
```

Check status of a run

### **Parameters**

**id** [integer] The ID of the custom.

run\_id [integer] The ID of the run.

# Returns

id [integer] The ID of the run.

**custom id** [integer] The ID of the custom.

**Returns** 

id [integer] The ID for the script.

name [string] The name of the script.

type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)

created\_at [string/time] The time this script was created.

updated\_at [string/time] The time the script was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's

or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.

allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on. running as [dict::]
  - id [integer] The ID of this user.

```
• name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  next run at [string/time] The time of the next scheduled run.
                  time zone [string] The time zone of this script.
                  last run [dict::]
                            • id: integer
                            · state: string
                            • created_at [string/time] The time that the run was queued.
                            • started_at [string/time] The time that the run started.
                            • finished_at [string/time] The time that the run completed.
                            • error [string] The error message for this run, if present.
                  hidden [boolean] The hidden status of the item.
                  target_project_id [integer] Target project to which script outputs will be added.
                  archived [string] The archival status of the requested item(s).
                  source [string] The body/text of the script.
                  remote_host_id [integer] The remote host ID that this script will connect to.
                  credential id [integer] The credential that this script will use.
get_javascript_git_commits (id, commit_hash)
      Get file contents at commit hash
            Parameters
                  id [integer] The ID of the file.
                  commit_hash [string] The SHA (full or shortened) of the desired git commit.
            Returns
                  content [string] The file's contents.
                  type [string] The file's type.
                  size [integer] The file's size.
                  file_hash [string] The SHA of the file.
get javascript runs(id, run id)
      Check status of a run
            Parameters
                  id [integer] The ID of the javascript.
                  run_id [integer] The ID of the run.
            Returns
                  id [integer] The ID of the run.
                  javascript id [integer] The ID of the javascript.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                         'cancelled'.
                  is_cancel_requested [boolean] True if run cancel requested, else false.
                  started_at [string/time] The time the last run started at.
                  finished_at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
get_python3 (id)
      Get a Python Script
            Parameters
                  id [integer]
            Returns
```

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script
user\_context [string] "runner" or "author", who to execute the script as when run as
a template.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template. **published as template id** [integer] The ID of the template that this script is backing.

from\_template\_id [integer] The ID of the template this script uses, if any.
template\_dependents\_count [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

### running as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

last\_run [dict::]

• id: integer

- state: string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

source [string] The body/text of the script.

**cancel\_timeout** [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

### get\_python3\_git\_commits (id, commit\_hash)

Get file contents at commit\_hash

#### **Parameters**

id [integer] The ID of the file.

**commit\_hash** [string] The SHA (full or shortened) of the desired git commit.

### Returns

**content** [string] The file's contents.

type [string] The file's type.

size [integer] The file's size.

file\_hash [string] The SHA of the file.

### get\_python3\_runs (id, run\_id)

Check status of a run

### **Parameters**

**id** [integer] The ID of the python.

run\_id [integer] The ID of the run.

### Returns

id [integer] The ID of the run.

**python\_id** [integer] The ID of the python.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

started\_at [string/time] The time the last run started at.

finished\_at [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

```
get_r (id)
    Get an R Script
    Parameters
        id [integer]
    Returns
        id [integer] The ID for the script.
            name [string] The name of the script.
            type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
            created_at [string/time] The time this script was created.
            updated_at [string/time] The time the script was last updated.
            author [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from template id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - **scheduled** [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next\_run\_at** [string/time] The time of the next scheduled run.

```
time zone [string] The time zone of this script.
                  last run [dict::]
                             • id: integer
                             • state: string
                             • created at [string/time] The time that the run was queued.
                             • started at [string/time] The time that the run started.
                             • finished_at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  hidden [boolean] The hidden status of the item.
                  target project id [integer] Target project to which script outputs will be added.
                  archived [string] The archival status of the requested item(s).
                  required_resources [dict::]
                             • cpu [integer] The number of CPU shares to allocate for the container.
                                    Each core has 1024 shares. Must be at least 2 shares.
                             • memory [integer] The amount of RAM to allocate for the container (in
                                    MiB). Must be at least 4 MiB.
                             • disk_space [number/float] The amount of disk space, in GB, to allocate
                                    for the container. This space will be used to hold the git repo config-
                                    ured for the container and anything your container writes to /tmp or
                                    /data. Fractional values (e.g. 0.25) are supported.
                  instance type [string] The EC2 instance type to deploy to. Only available for jobs
                        running on kubernetes.
                  source [string] The body/text of the script.
                  cancel_timeout [integer] The amount of time (in seconds) to wait before forcibly ter-
                        minating the script. When the script is cancelled, it is first sent a TERM signal.
                        If the script is still running after the timeout, it is sent a KILL signal. Defaults to
                        0.
get_r_git_commits (id, commit_hash)
      Get file contents at commit hash
            Parameters
                  id [integer] The ID of the file.
                  commit hash [string] The SHA (full or shortened) of the desired git commit.
            Returns
                  content [string] The file's contents.
                  type [string] The file's type.
                  size [integer] The file's size.
                  file hash [string] The SHA of the file.
get_r_runs (id, run_id)
      Check status of a run
            Parameters
                  id [integer] The ID of the r.
                  run_id [integer] The ID of the run.
            Returns
```

6.5. API Client 421

is cancel requested [boolean] True if run cancel requested, else false.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or

id [integer] The ID of the run.r\_id [integer] The ID of the r.

'cancelled'.

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

**projects** [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.

• allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.

- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next run at** [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

last run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target project id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

sql [string] The raw SQL query for the script.

**expanded\_arguments** [dict] Expanded arguments for use in injecting into different environments.

remote\_host\_id [integer] The remote host ID that this script will connect to.

credential id [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
csv settings [dict::]

- **include\_header** [boolean] Whether or not to include headers in the output data. Default: true
- **compression** [string] The type of compression to use, if any, one of "none", "zip", or "gzip". Default: gzip
- **column\_delimiter** [string] Which delimiter to use, one of "comma", "tab", or "pipe". Default: comma
- unquoted [boolean] Whether or not to quote fields. Default: false
- **force\_multifile** [boolean] Whether or not the csv should be split into multiple files. Default: false
- filename\_prefix [string] A user specified filename prefix for the output file to have. Default: null

### get\_sql\_git\_commits (id, commit\_hash)

Get file contents at commit\_hash

#### **Parameters**

id [integer] The ID of the file.

commit\_hash [string] The SHA (full or shortened) of the desired git commit.

#### **Returns**

**content** [string] The file's contents.

**type** [string] The file's type.

size [integer] The file's size.

file\_hash [string] The SHA of the file.

# get\_sql\_runs (id, run\_id)

Check status of a run

Parameters

```
id [integer] The ID of the sql.
    run_id [integer] The ID of the run.

Returns
    id [integer] The ID of this run.
    sql_id [integer] The ID of this sql.
    state [string] The state of this run.
    is_cancel_requested [boolean] True if run cancel requested, else false.
    started_at [string/time] The time the last run started.
    finished_at [string/time] The time that this run finished.
    error [string] The error message for this run, if present.
    output [list::] A list of the outputs of this script. - output_name : string
```

The name of the output file.

- file\_id [integer] The unique ID of the output file.
- path [string] The temporary link to download this output file, valid for 36 hours.

list (\*, type='DEFAULT', category='DEFAULT', author='DEFAULT', status='DEFAULT', hidden='DEFAULT', archived='DEFAULT', limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')
List scripts

#### **Parameters**

**type** [string, optional] If specified, return items of these types. The valid types are sql, python3, javascript, r, and containers.

**category** [string, optional] A job category for filtering scripts. Must be one of script, import, export, and enhancement.

author [string, optional] If specified, return items from this author. Must use user IDs.
A comma separated list of IDs is also accepted to return items from multiple authors.

**status** [string, optional] If specified, returns items with one of these statuses. It accepts a comma- separated list, possible values are 'running', 'failed', 'succeeded', 'idle', 'scheduled'.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**archived** [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at, last\_run.updated\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

```
id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created_at [string/time] The time this script was created.
updated_at [string/time] The time the script was last updated.
author [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script
is\_template [boolean] Whether others scripts use this one as a template.
from\_template\_id [integer] The ID of the template this script uses, if any.
links [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. time\_zone [string] The time zone of this script. last\_run [dict::]
  - ------
    - id : integer
    - state: string
    - created\_at [string/time] The time that the run was queued.
    - **started\_at** [string/time] The time that the run started.
    - finished\_at [string/time] The time that the run completed.
    - **error** [string] The error message for this run, if present.

**archived** [string] The archival status of the requested item(s).

template\_script\_id [integer] The ID of the template script, if any.

list\_containers\_projects (id, \*, hidden='DEFAULT')

List the projects a container docker belongs to

#### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

### **Returns**

id [integer] The ID for this project.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of this project.

**description** [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto share [boolean]

created\_at [string/time]

updated\_at [string/time]

**archived** [string] The archival status of the requested item(s).

List runs for the given container

#### **Parameters**

**id** [integer] The ID of the container.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

### Returns

id [integer] The ID of the run.

container id [integer] The ID of the container.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

**finished\_at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

# list\_containers\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')

Get the logs for a run

#### **Parameters**

id [integer] The ID of the container.

run\_id [integer] The ID of the run.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

### Returns

id [integer] The ID of the log.

created\_at [string/date-time] The time the log was created.

message [string] The log message.

level [string] The level of the log. One of unknown,fatal,error,warn,info,debug.

```
list_containers_runs_outputs(id, run_id, *, limit='DEFAULT', page_num='DEFAULT',
                                          order='DEFAULT',
                                                                   order dir='DEFAULT',
                                                                                                itera-
                                          tor='DEFAULT')
     List the outputs for a run
            Parameters
                  id [integer] The ID of the container script.
                  run id [integer] The ID of the run.
                  limit [integer, optional] Number of results to return. Defaults to its maximum of 50.
                  page_num [integer, optional] Page number of the results to return. Defaults to the first
                  order [string, optional] The field on which to order the result set. Defaults to cre-
                        ated_at. Must be one of: created_at, id.
                  order_dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                        (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                        limit and page num are ignored. Defaults to False.
            Returns
                  object_type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
list\_containers\_shares(id)
      List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     – id : integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
```

- name: string

• groups [list::]

- id: integer

- name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

# Parameters

**from\_template\_id** [string, optional] If specified, return scripts based on the template with this ID. Specify multiple IDs as a comma-separated list.

**author** [string, optional] If specified, return items from this author. Must use user IDs. A comma separated list of IDs is also accepted to return items from multiple authors.

**status** [string, optional] If specified, returns items with one of these statuses. It accepts a comma- separated list, possible values are 'running', 'failed', 'succeeded', 'idle', 'scheduled'.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**archived** [string, optional] The archival status of the requested item(s).

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

# Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g Custom)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

projects [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script
from\_template\_id [integer] The ID of the template script.
time\_zone [string] The time zone of this script.

last\_run [dict::]

- id: integer
- · state: string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**archived** [string] The archival status of the requested item(s).

list\_custom\_projects (id, \*, hidden='DEFAULT')

List the projects a Job belongs to

#### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

#### Returns

id [integer] The ID for this project.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of this project.

description [string] A description of the project.

users [list::] Users who can see the project. - id : integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto\_share [boolean]
created\_at [string/time]
updated\_at [string/time]
archived [string] The archival status of the requested item(s).

list\_custom\_runs (id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order='DEFAULT', iterator='DEFAULT')

List runs for the given custom

**Parameters** 

id [integer] The ID of the custom.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The ID of the run.

custom\_id [integer] The ID of the custom.

state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

**finished at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

# list\_custom\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')

Get the logs for a run

#### **Parameters**

id [integer] The ID of the custom.

run\_id [integer] The ID of the run.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

#### **Returns**

id [integer] The ID of the log.

created\_at [string/date-time] The time the log was created.

message [string] The log message.

level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.

list\_custom\_runs\_outputs (id, run\_id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order dir='DEFAULT', iterator='DEFAULT')

List the outputs for a run

#### **Parameters**

id [integer] The ID of the custom script.

run\_id [integer] The ID of the run.

limit [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to created at. Must be one of: created at, id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

```
object_type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
list\_custom\_shares(id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  writers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  owners [dict::]
                            • users [list::]
                                      - id: integer
                                      - name : string
                            • groups [list::]
                                      - id: integer
                                      - name : string
                  total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
list_history(id)
      Get the run history and outputs of this script
            Parameters
                  id [integer] The ID for the script.
            Returns
                  id [integer] The ID of this run.
                  sql_id [integer] The ID of this sql.
                  state [string] The state of this run.
```

```
finished_at [string/time] The time that this run finished.
                  error [string] The error message for this run, if present.
                  output [list::] A list of the outputs of this script. - output_name : string
                              The name of the output file.
                            • file id [integer] The unique ID of the output file.
                            • path [string] The temporary link to download this output file, valid for 36
                                    hours.
list_javascript_git (id)
      Get the git metadata attached to this scripted sql
            Parameters
                  id [integer] The ID of the file.
            Returns
                  git_ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git_branch [string] The git branch that the file is on.
                  git_path [string] The path of the file in the repository.
                  git repo [dict::]
                            • id [integer] The ID for this git repository.
                            • repo url [string] The URL for this git repository.
                            · created at : string/time
                            • updated_at : string/time
list_javascript_git_commits(id)
      Get the git commits for this scripted sql
            Parameters
                  id [integer] The ID of the file.
            Returns
                  commit_hash [string] The SHA of the commit.
                  author_name [string] The name of the commit's author.
                  date [string/time] The commit's timestamp.
                  message [string] The commit message.
list_javascript_projects(id, *, hidden='DEFAULT')
      List the projects a scripted sql belongs to
            Parameters
                  id [integer] The ID of the resource.
                  hidden [boolean, optional] If specified to be true, returns hidden items. Defaults to
                        false, returning non-hidden items.
            Returns
                  id [integer] The ID for this project.
                  author [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
```

is cancel requested [boolean] True if run cancel requested, else false.

6.5. API Client 433

**name** [string] The name of this project.

```
description [string] A description of the project.
```

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto\_share [boolean]

created\_at [string/time]

updated\_at [string/time]

**archived** [string] The archival status of the requested item(s).

# 

List runs for the given javascript

#### **Parameters**

id [integer] The ID of the javascript.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 100.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### **Returns**

id [integer] The ID of the run.

**javascript\_id** [integer] The ID of the javascript.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

**finished at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

# list\_javascript\_runs\_logs (id, run\_id, \*, last\_id='DEFAULT', limit='DEFAULT')

Get the logs for a run

# Parameters

id [integer] The ID of the javascript.

run\_id [integer] The ID of the run.

**last\_id** [integer, optional] The ID of the last log message received. Log entries with this ID value or lower will be omitted.Logs are sorted by ID if this value is provided, and are otherwise sorted by createdAt.

**limit** [integer, optional] The maximum number of log messages to return. Default of 10000.

### Returns

id [integer] The ID of the log.

created\_at [string/date-time] The time the log was created.

message [string] The log message.

```
level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.
list_javascript_runs_outputs (id, run_id, *, limit='DEFAULT', page_num='DEFAULT',
                                          order='DEFAULT',
                                                                   order dir='DEFAULT',
                                                                                                itera-
                                          tor='DEFAULT')
     List the outputs for a run
            Parameters
                  id [integer] The ID of the javascript script.
                  run_id [integer] The ID of the run.
                  limit [integer, optional] Number of results to return. Defaults to its maximum of 50.
                  page_num [integer, optional] Page number of the results to return. Defaults to the first
                        page, 1.
                  order [string, optional] The field on which to order the result set. Defaults to cre-
                        ated_at. Must be one of: created_at, id.
                  order_dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                        (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                        limit and page num are ignored. Defaults to False.
            Returns
                  object_type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
list_javascript_shares (id)
      List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
```

```

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

### list\_python3\_git (id)

Get the git metadata attached to this python docker

#### **Parameters**

id [integer] The ID of the file.

#### **Returns**

git\_ref [string] A git reference specifying an unambiguous version of the file. Can be
a branch name, or the full or shortened SHA of a commit.

git\_branch [string] The git branch that the file is on.
git path [string] The path of the file in the repository.

git\_repo [dict::]

- id [integer] The ID for this git repository.
- repo\_url [string] The URL for this git repository.
- created\_at : string/time
- updated\_at : string/time

# list\_python3\_git\_commits(id)

Get the git commits for this python docker

#### **Parameters**

id [integer] The ID of the file.

### **Returns**

```
commit_hash [string] The SHA of the commit.
author_name [string] The name of the commit's author.
date [string/time] The commit's timestamp.
message [string] The commit message.
```

# list\_python3\_projects (id, \*, hidden='DEFAULT')

List the projects a python docker belongs to

### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

### Returns

```
id [integer] The ID for this project.
author [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

```
name [string] The name of this project.
                  description [string] A description of the project.
                  users [list::] Users who can see the project. - id: integer
                              The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  auto share [boolean]
                  created_at [string/time]
                  updated at [string/time]
                  archived [string] The archival status of the requested item(s).
list_python3_runs (id, *, limit='DEFAULT', page_num='DEFAULT', order='DEFAULT', or-
                          der dir='DEFAULT', iterator='DEFAULT')
      List runs for the given python
            Parameters
                  id [integer] The ID of the python.
                  limit [integer, optional] Number of results to return. Defaults to 20. Maximum al-
                        lowed is 100.
                  page num [integer, optional] Page number of the results to return. Defaults to the first
                  order [string, optional] The field on which to order the result set. Defaults to id. Must
                        be one of: id.
                  order dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                        (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                        limit and page_num are ignored. Defaults to False.
            Returns
                  id [integer] The ID of the run.
                  python_id [integer] The ID of the python.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                        'cancelled'.
                  is_cancel_requested [boolean] True if run cancel requested, else false.
                  started at [string/time] The time the last run started at.
                  finished_at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
list_python3_runs_logs (id, run_id, *, last_id='DEFAULT', limit='DEFAULT')
      Get the logs for a run
            Parameters
                  id [integer] The ID of the python.
                  run id [integer] The ID of the run.
                  last_id [integer, optional] The ID of the last log message received. Log entries with
                        this ID value or lower will be omitted. Logs are sorted by ID if this value is
                        provided, and are otherwise sorted by createdAt.
                  limit [integer, optional] The maximum number of log messages to return. Default of
                        10000.
            Returns
                  id [integer] The ID of the log.
                  created_at [string/date-time] The time the log was created.
```

```
message [string] The log message.
                  level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.
list_python3_runs_outputs(id, run_id, *, limit='DEFAULT', page_num='DEFAULT', or-
                                     der='DEFAULT', order_dir='DEFAULT', iterator='DEFAULT')
      List the outputs for a run
            Parameters
                  id [integer] The ID of the python script.
                  run_id [integer] The ID of the run.
                  limit [integer, optional] Number of results to return. Defaults to its maximum of 50.
                  page num [integer, optional] Page number of the results to return. Defaults to the first
                        page, 1.
                  order [string, optional] The field on which to order the result set. Defaults to cre-
                        ated_at. Must be one of: created_at, id.
                  order dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                        (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                        limit and page_num are ignored. Defaults to False.
            Returns
                  object_type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object_id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
list_python3_shares(id)
      List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
```

```
- id: integer
                                      - name : string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
      Get the git metadata attached to this r docker
                  id [integer] The ID of the file.
                  git_ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git branch [string] The git branch that the file is on.
                  git path [string] The path of the file in the repository.
                  git_repo [dict::]
                            • id [integer] The ID for this git repository.
                            • repo url [string] The URL for this git repository.
                            · created at : string/time
                            • updated_at : string/time
list_r_git_commits(id)
      Get the git commits for this r docker
                  id [integer] The ID of the file.
                  commit_hash [string] The SHA of the commit.
                  author name [string] The name of the commit's author.
                  date [string/time] The commit's timestamp.
                  message [string] The commit message.
list_r_projects (id, *, hidden='DEFAULT')
      List the projects a r docker belongs to
                  id [integer] The ID of the resource.
                  hidden [boolean, optional] If specified to be true, returns hidden items. Defaults to
                        false, returning non-hidden items.
                  id [integer] The ID for this project.
                  author [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
```

6.5. API Client 439

• online [boolean] Whether this user is online.

• username [string] This user's username.

• initials [string] This user's initials.

**name** [string] The name of this project.

```
description [string] A description of the project.
                  users [list::] Users who can see the project. - id: integer
                              The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  auto share [boolean]
                  created_at [string/time]
                  updated at [string/time]
                  archived [string] The archival status of the requested item(s).
                       *, limit='DEFAULT', page_num='DEFAULT', order='DEFAULT', or-
list_r_runs (id,
                 der dir='DEFAULT', iterator='DEFAULT')
      List runs for the given r
            Parameters
                  id [integer] The ID of the r.
                  limit [integer, optional] Number of results to return. Defaults to 20. Maximum al-
                        lowed is 100.
                  page num [integer, optional] Page number of the results to return. Defaults to the first
                  order [string, optional] The field on which to order the result set. Defaults to id. Must
                        be one of: id.
                  order dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                        (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                        limit and page_num are ignored. Defaults to False.
            Returns
                  id [integer] The ID of the run.
                  r_id [integer] The ID of the r.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                        'cancelled'.
                  is_cancel_requested [boolean] True if run cancel requested, else false.
                  started at [string/time] The time the last run started at.
                  finished_at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
list_r_runs_logs (id, run_id, *, last_id='DEFAULT', limit='DEFAULT')
      Get the logs for a run
            Parameters
                  id [integer] The ID of the r.
                  run id [integer] The ID of the run.
                  last_id [integer, optional] The ID of the last log message received. Log entries with
                        this ID value or lower will be omitted. Logs are sorted by ID if this value is
                        provided, and are otherwise sorted by createdAt.
                  limit [integer, optional] The maximum number of log messages to return. Default of
                        10000.
            Returns
                  id [integer] The ID of the log.
                  created_at [string/date-time] The time the log was created.
```

```
message [string] The log message.
                  level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.
list_r_runs_outputs (id,
                                  run id,
                                             *, limit='DEFAULT', page_num='DEFAULT',
                             der='DEFAULT', order_dir='DEFAULT', iterator='DEFAULT')
     List the outputs for a run
            Parameters
                  id [integer] The ID of the r script.
                  run_id [integer] The ID of the run.
                  limit [integer, optional] Number of results to return. Defaults to its maximum of 50.
                  page num [integer, optional] Page number of the results to return. Defaults to the first
                        page, 1.
                  order [string, optional] The field on which to order the result set. Defaults to cre-
                        ated_at. Must be one of: created_at, id.
                  order dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                        (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                        limit and page_num are ignored. Defaults to False.
            Returns
                  object_type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object_id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
list r shares(id)
      List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
```

Returns

**Returns** 

**Returns** 

```
- id: integer
                                      - name : string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
list_sql_git (id)
      Get the git metadata attached to this scripts
            Parameters
                  id [integer] The ID of the file.
                  git_ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git branch [string] The git branch that the file is on.
                  git path [string] The path of the file in the repository.
                  git_repo [dict::]
                            • id [integer] The ID for this git repository.
                            • repo url [string] The URL for this git repository.
                            · created at : string/time
                            • updated_at : string/time
list_sql_git_commits(id)
      Get the git commits for this scripts
            Parameters
                  id [integer] The ID of the file.
                  commit_hash [string] The SHA of the commit.
                  author name [string] The name of the commit's author.
                  date [string/time] The commit's timestamp.
                  message [string] The commit message.
list_sql_projects (id, *, hidden='DEFAULT')
      List the projects a scripts belongs to
            Parameters
                  id [integer] The ID of the resource.
                  hidden [boolean, optional] If specified to be true, returns hidden items. Defaults to
                        false, returning non-hidden items.
                  id [integer] The ID for this project.
                  author [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
```

• username [string] This user's username.

• online [boolean] Whether this user is online.

• initials [string] This user's initials.

Chapter 6. Client API Reference

```
name [string] The name of this project.
                  description [string] A description of the project.
                  users [list::] Users who can see the project. - id: integer
                              The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  auto share [boolean]
                  created_at [string/time]
                  updated at [string/time]
                  archived [string] The archival status of the requested item(s).
list_sql_runs(id, *, limit='DEFAULT', page_num='DEFAULT', order='DEFAULT', or-
                    der dir='DEFAULT', iterator='DEFAULT')
     List runs for the given sql
            Parameters
                  id [integer] The ID of the sql.
                  limit [integer, optional] Number of results to return. Defaults to 20. Maximum al-
                        lowed is 100.
                  page num [integer, optional] Page number of the results to return. Defaults to the first
                  order [string, optional] The field on which to order the result set. Defaults to id. Must
                        be one of: id.
                  order dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                        (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                        limit and page_num are ignored. Defaults to False.
            Returns
                  id [integer] The ID of this run.
                  sql_id [integer] The ID of this sql.
                  state [string] The state of this run.
                  is_cancel_requested [boolean] True if run cancel requested, else false.
                  started_at [string/time] The time the last run started.
                  finished at [string/time] The time that this run finished.
                  error [string] The error message for this run, if present.
                  output [list::] A list of the outputs of this script. - output name : string
                              The name of the output file.
                            • file id [integer] The unique ID of the output file.
                            • path [string] The temporary link to download this output file, valid for 36
list_sql_runs_logs (id, run_id, *, last_id='DEFAULT', limit='DEFAULT')
      Get the logs for a run
            Parameters
                  id [integer] The ID of the sql.
```

6.5. API Client 443

run\_id [integer] The ID of the run.

```
last id [integer, optional] The ID of the last log message received. Log entries with
                        this ID value or lower will be omitted. Logs are sorted by ID if this value is
                        provided, and are otherwise sorted by createdAt.
                  limit [integer, optional] The maximum number of log messages to return. Default of
                        10000.
            Returns
                  id [integer] The ID of the log.
                  created at [string/date-time] The time the log was created.
                  message [string] The log message.
                  level [string] The level of the log. One of unknown, fatal, error, warn, info, debug.
list_sql_runs_outputs(id, run_id, *, limit='DEFAULT', page_num='DEFAULT', or-
                                der='DEFAULT', order dir='DEFAULT', iterator='DEFAULT')
     List the outputs for a run
            Parameters
                  id [integer] The ID of the sql script.
                  run id [integer] The ID of the run.
                  limit [integer, optional] Number of results to return. Defaults to its maximum of 50.
                  page_num [integer, optional] Page number of the results to return. Defaults to the first
                        page, 1.
                  order [string, optional] The field on which to order the result set. Defaults to cre-
                        ated at. Must be one of: created at, id.
                  order_dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                        (descending) defaulting to desc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                        limit and page num are ignored. Defaults to False.
            Returns
                  object_type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object_id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
list_sql_shares(id)
      List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
```

- name: string

id : integername : string

writers [dict::]

• users [list::]

```
• groups [list::]
```

id : integername : string

owners [dict::]

• users [list::]

- id: integer

- name: string

• groups [list::]

- id: integer

- name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

#### list\_types()

List available script types

#### Returns

**name** [string] The name of the type.

### **Parameters**

id [integer] The ID for the script.

name [string, optional] The name of the script.

sql [string, optional] The raw SQL query for the script.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. Cannot be set if this script uses a template script. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an

array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**template\_script\_id** [integer, optional] The ID of the template script, if any. A script cannot both have a template script and be a template for other scripts.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

parent\_id [integer, optional] The ID of the parent job that will trigger this script
Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of script.
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time this script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.

• online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

is\_template [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.

- **scheduled\_hours** [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success email subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

**time\_zone** [string] The time zone of this script.

# last\_run [dict::]

- id: integer
- state : string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

sql [string] The raw SQL query for the script.

**expanded\_arguments** [dict] Expanded arguments for use in injecting into different environments.

**template\_script\_id** [integer] The ID of the template script, if any.

```
patch_containers (id, *, name='DEFAULT', parent_id='DEFAULT', user_context='DEFAULT',
                     params='DEFAULT',
                                           arguments='DEFAULT',
                                                                     schedule='DEFAULT'.
                     notifications='DEFAULT',

                                                       time_zone='DEFAULT',
                     get_project_id='DEFAULT')
```

Update a container

#### **Parameters**

id [integer] The ID for the script.

name [string, optional] The name of the container.

parent\_id [integer, optional] The ID of the parent job that will trigger this script
user\_context [string, optional] "runner" or "author", who to execute the script as
 when run as a template.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters. **schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.

• **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### **notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- **failure on** [boolean] If failure email notifications are on.

### required resources [dict, optional::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB).
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.
- whole\_instance [boolean] Whether or not to use the entire instance. If true, cpu, memory, and disk space are not required and will be set to an instance's max.
- **repo\_http\_uri** [string, optional] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.
- **repo\_ref** [string, optional] The tag or branch of the github repo to clone into the container.
- **remote\_host\_credential\_id** [integer, optional] The id of the database credentials to pass into the environment of the container.
- **git\_credential\_id** [integer, optional] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.
- **docker\_command** [string, optional] The command to run on the container. Will be run via sh as: ["sh", "-c", dockerCommand].
- **docker\_image\_name** [string, optional] The name of the docker image to pull from DockerHub.
- **docker\_image\_tag** [string, optional] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string, optional] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

cancel\_timeout [integer, optional] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

**time\_zone** [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

### Returns

id [integer] The ID for the script.
name [string] The name of the container.
type [string] The type of the script (e.g Container)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's

or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.

allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on. running as [dict::]
  - id [integer] The ID of this user.

- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

### required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- memory [integer] The amount of RAM to allocate for the container (in MiB).
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.
- **repo\_http\_uri** [string] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.

**repo\_ref** [string] The tag or branch of the github repo to clone into the container.

**remote\_host\_credential\_id** [integer] The id of the database credentials to pass into the environment of the container.

git\_credential\_id [integer] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.

**docker\_command** [string] The command to run on the container. Will be run via sh as: ["sh", "-c", dockerCommand].

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

# last\_run [dict::]

- id: integer
- state : string
- **created at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

time\_zone [string] The time zone of this script.

**hidden** [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

**target\_project\_id** [integer] Target project to which script outputs will be added.

**Parameters** 

id [integer] The ID for the script.

name [string, optional] The name of the script.

parent\_id [integer, optional] The ID of the parent job that will trigger this scriptarguments [dict, optional] Parameter-value pairs to use when running this script.Only settable if this script has defined parameters.

remote\_host\_id [integer, optional] The remote host ID that this script will connect to.
credential\_id [integer, optional] The credential that this script will use.
schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

**time zone** [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

#### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g Custom)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.

- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

finished\_at [string/time] The time that the script's last run finished.

category [string]

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this scriptparams [list::] A definition of the parameters this script accepts in the arguments field.- name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from template id [integer] The ID of the template script.

ui\_report\_url [integer] The url of the custom HTML.

ui\_report\_id [integer] The id of the report with the custom HTML.

ui\_report\_provide\_api\_key [boolean] Whether the ui report requests an API Key
from the report viewer.

**template\_script\_name** [string] The name of the template script.

template\_note [string] The template's note.

**remote host id** [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
schedule [dict::]

• **scheduled** [boolean] If the item is scheduled.

- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

time\_zone [string] The time zone of this script.

# last\_run [dict::]

- id: integer
- state : string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

target\_project\_id [integer] Target project to which script outputs will be added.

Update some attributes of this JavaScript Script

#### **Parameters**

id [integer] The ID for the script.

name [string, optional] The name of the script.

parent\_id [integer, optional] The ID of the parent job that will trigger this script
user\_context [string, optional] "runner" or "author", who to execute the script as
 when run as a template.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

- schedule [dict, optional::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.

- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**next\_run\_at** [string/time, optional] The time of the next scheduled run.

**time\_zone** [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

source [string, optional] The body/text of the script.

**remote\_host\_id** [integer, optional] The remote host ID that this script will connect to. **credential\_id** [integer, optional] The credential that this script will use.

#### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

**params** [list::] A definition of the parameters this script accepts in the arguments field.

- name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - **scheduled** [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday
  - scheduled hours [list] Hours of the day it is scheduled on.
  - scheduled minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.

- success email from name [string] Name from which success emails are sent: defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure email addresses [list] Addresses to notify by e-mail when the iob fails.
- stall warning minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- **failure on** [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next run at** [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

last run [dict::]

- id: integer
- · state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target project id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

**source** [string] The body/text of the script.

**remote host id** [integer] The remote host ID that this script will connect to.

credential id [integer] The credential that this script will use.

```

# **Parameters**

id [integer] The ID for the script.

**name** [string, optional] The name of the script.

parent\_id [integer, optional] The ID of the parent job that will trigger this script user\_context [string, optional] "runner" or "author", who to execute the script as

when run as a template. params [list, optional::] A definition of the parameters this script accepts in the argu-

ments field. - name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters. **schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.

- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

**next run at** [string/time, optional] The time of the next scheduled run.

time\_zone [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

required\_resources [dict, optional::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- disk\_space [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string, optional] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**source** [string, optional] The body/text of the script.

**cancel\_timeout** [integer, optional] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

#### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- **initials** [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

**category** [string] The category of the script.

**projects** [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

**params** [list::] A definition of the parameters this script accepts in the arguments field.

- name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - **scheduled** [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled hours [list] Hours of the day it is scheduled on.
  - scheduled minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

# notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.

- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next run at** [string/time] The time of the next scheduled run.

**time\_zone** [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state : string
- **created\_at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- **finished at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

required resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- disk\_space [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**source** [string] The body/text of the script.

**cancel\_timeout** [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

#### **Parameters**

id [integer] The ID for the script.

**name** [string, optional] The name of the script.

parent\_id [integer, optional] The ID of the parent job that will trigger this script
user\_context [string, optional] "runner" or "author", who to execute the script as
 when run as a template.

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters. **schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.

- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**next\_run\_at** [string/time, optional] The time of the next scheduled run.

**time\_zone** [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

required\_resources [dict, optional::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- disk\_space [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string, optional] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**source** [string, optional] The body/text of the script.

cancel\_timeout [integer, optional] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

#### **Returns**

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.finished\_at [string/time] The time that the script's last run finished.category [string] The category of the script.projects [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from template id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.

- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success email subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

**time\_zone** [string] The time zone of this script.

# last\_run [dict::]

- id: integer
- state : string
- **created\_at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

# required\_resources [dict::]

• **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.

- memory [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- disk\_space [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

source [string] The body/text of the script.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

Update some attributes of this SQL script

#### **Parameters**

id [integer] The ID for the script.

name [string, optional] The name of the script.

parent\_id [integer, optional] The ID of the parent job that will trigger this script
user\_context [string, optional] "runner" or "author", who to execute the script as
when run as a template.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

schedule [dict, optional::]

- **scheduled** [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## **notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**next\_run\_at** [string/time, optional] The time of the next scheduled run.

**time\_zone** [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

**sql** [string, optional] The raw SQL query for the script.

remote\_host\_id [integer, optional] The remote host ID that this script will connect to.
credential\_id [integer, optional] The credential that this script will use.
csv settings [dict, optional::]

- include\_header [boolean] Whether or not to include headers in the output data. Default: true
- **compression** [string] The type of compression to use, if any, one of "none", "zip", or "gzip". Default: gzip
- **column\_delimiter** [string] Which delimiter to use, one of "comma", "tab", or "pipe". Default: comma
- unquoted [boolean] Whether or not to quote fields. Default: false
- **force\_multifile** [boolean] Whether or not the csv should be split into multiple files. Default: false
- filename\_prefix [string] A user specified filename prefix for the output file to have. Default: null

#### Returns

```
id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created_at [string/time] The time this script was created.
updated_at [string/time] The time the script was last updated.
author [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script
user\_context [string] "runner" or "author", who to execute the script as when run as
a template.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

is\_template [boolean] Whether others scripts use this one as a template.published\_as\_template\_id [integer] The ID of the template that this script is backing.

from\_template\_id [integer] The ID of the template this script uses, if any.
template\_dependents\_count [integer] How many other scripts use this one as a template

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

### running as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

last\_run [dict::]

• id : integer

- state: string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

sql [string] The raw SQL query for the script.

**expanded\_arguments** [dict] Expanded arguments for use in injecting into different environments.

 ${\bf remote\_host\_id} \ \ [{\bf integer}] \ The \ remote \ host \ ID \ that \ this \ script \ will \ connect \ to.$ 

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
csv\_settings [dict::]

- **include\_header** [boolean] Whether or not to include headers in the output data. Default: true
- compression [string] The type of compression to use, if any, one of "none", "zip", or "gzip". Default: gzip
- **column\_delimiter** [string] Which delimiter to use, one of "comma", "tab", or "pipe". Default: comma
- unquoted [boolean] Whether or not to quote fields. Default: false
- **force\_multifile** [boolean] Whether or not the csv should be split into multiple files. Default: false
- **filename\_prefix** [string] A user specified filename prefix for the output file to have. Default: null

post (name, remote\_host\_id, credential\_id, sql, \*, params='DEFAULT', arguments='DEFAULT', template\_script\_id='DEFAULT', notifications='DEFAULT', hidden='DEFAULT') Create a script

### **Parameters**

**name** [string] The name of the script.

remote\_host\_id [integer] The database ID.

**credential\_id** [integer] The credential ID.

sql [string] The raw SQL query for the script.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. Cannot be set if this script uses a template script. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.

- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**template\_script\_id** [integer, optional] The ID of the template script, if any. A script cannot both have a template script and be a template for other scripts. **notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the iob fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**hidden** [boolean, optional] The hidden status of the item.

# Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled hours [list] Hours of the day it is scheduled on.

- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**next\_run\_at** [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

## last\_run [dict::]

- id : integer
- state: string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

**template\_script\_id** [integer] The ID of the template script, if any.

post\_cancel(id)

Cancel a run

**Parameters** 

```
id [integer] The ID of the job.
```

#### Returns

id [integer] The ID of the run.

state [string] The state of the run, one of 'queued', 'running' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

```
*, name='DEFAULT', par-
post containers (required resources,
                                       docker image name,
                    ent id='DEFAULT',
                                          user context='DEFAULT',
                                                                      params='DEFAULT',
                    arguments='DEFAULT',
                                                   schedule='DEFAULT',
                                                                                 notifica-
                    tions='DEFAULT',
                                        repo_http_uri='DEFAULT',
                                                                     repo_ref='DEFAULT'.
                    remote_host_credential_id='DEFAULT',
                                                             git_credential_id='DEFAULT',
                    docker_command='DEFAULT',
                                                            docker_image_tag='DEFAULT',
                    instance_type='DEFAULT',
                                                               cancel timeout='DEFAULT'.
                    time_zone='DEFAULT', hidden='DEFAULT', target_project_id='DEFAULT')
```

Create a container

# **Parameters**

## required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB).
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.
- whole\_instance [boolean] Whether or not to use the entire instance. If true, cpu, memory, and disk space are not required and will be set to an instance's max.

**docker\_image\_name** [string] The name of the docker image to pull from DockerHub. **name** [string, optional] The name of the container.

parent\_id [integer, optional] The ID of the parent job that will trigger this script
user\_context [string, optional] "runner" or "author", who to execute the script as
 when run as a template.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.

allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

schedule [dict, optional::]

- **scheduled** [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.
- **repo\_http\_uri** [string, optional] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.
- **repo\_ref** [string, optional] The tag or branch of the github repo to clone into the container.
- **remote\_host\_credential\_id** [integer, optional] The id of the database credentials to pass into the environment of the container.
- **git\_credential\_id** [integer, optional] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.
- **docker\_command** [string, optional] The command to run on the container. Will be run via sh as: ["sh", "-c", dockerCommand].
- **docker\_image\_tag** [string, optional] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string, optional] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**cancel\_timeout** [integer, optional] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

**time zone** [string, optional] The time zone of this script.

hidden [boolean, optional] The hidden status of the item.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

#### Returns

id [integer] The ID for the script.
name [string] The name of the container.
type [string] The type of the script (e.g Container)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's

or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.

• allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

**template\_script\_name** [string] The name of the template script.

links [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - **scheduled\_hours** [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on. running as [dict::]
  - id [integer] The ID of this user.

- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

### required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- memory [integer] The amount of RAM to allocate for the container (in MiB).
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.
- **repo\_http\_uri** [string] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.

**repo\_ref** [string] The tag or branch of the github repo to clone into the container.

**remote\_host\_credential\_id** [integer] The id of the database credentials to pass into the environment of the container.

**git\_credential\_id** [integer] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.

**docker\_command** [string] The command to run on the container. Will be run via sh as: ["sh", "-c", dockerCommand].

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

# last\_run [dict::]

- id: integer
- state : string
- **created at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

time\_zone [string] The time zone of this script.

**hidden** [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

target\_project\_id [integer] Target project to which script outputs will be added.

 $\begin{tabular}{ll} {\tt post\_containers\_clone} (id, & *, & clone\_schedule='DEFAULT', & clone\_triggers='DEFAULT', \\ & clone\_notifications='DEFAULT') \end{tabular}$ 

Clone this Container Script

# **Parameters**

id [integer] The ID for the script.

clone\_schedule [boolean, optional] If true, also copy the schedule to the new script.clone\_triggers [boolean, optional] If true, also copy the triggers to the new script.clone\_notifications [boolean, optional] If true, also copy the notifications to the new script.

#### Returns

id [integer] The ID for the script.
name [string] The name of the container.
type [string] The type of the script (e.g Container)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is template** [boolean] Whether others scripts use this one as a template.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

**template\_script\_name** [string] The name of the template script.

links [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

#### required resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB).
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**repo\_http\_uri** [string] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.

**repo\_ref** [string] The tag or branch of the github repo to clone into the container.

**remote\_host\_credential\_id** [integer] The id of the database credentials to pass into the environment of the container.

git\_credential\_id [integer] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.

**docker\_command** [string] The command to run on the container. Will be run via sh as: ["sh", "-c", dockerCommand].

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

last\_run [dict::]

- id : integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**time zone** [string] The time zone of this script.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

target\_project\_id [integer] Target project to which script outputs will be added.

# post\_containers\_runs (id)

Start a run

#### **Parameters**

id [integer] The ID of the container.

### Returns

id [integer] The ID of the run.

container\_id [integer] The ID of the container.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is cancel requested [boolean] True if run cancel requested, else false.

**started at** [string/time] The time the last run started at.

```
finished at [string/time] The time the last run completed.
                 error [string] The error, if any, returned by the run.
post_containers_runs_logs (id, run_id, *, message='DEFAULT', level='DEFAULT', mes-
                                     sages='DEFAULT', child_job_id='DEFAULT')
      Add log messages
            Parameters
                 id [integer] The ID of the script.
                 run id [integer] The ID of the script run.
                 message [string, optional] The log message to store.
                 level [string, optional] The log level of this message [default: info]
                 messages [list, optional::]
                           • message [string] The log message to store.
                           • level [string] The log level of this message [default: info]
                           • created at : string/date-time
                 child_job_id [integer, optional] The ID of the child job the message came from.
            Returns
                 None Response code 204: success
post_containers_runs_outputs (id, run_id, object_type, object_id)
      Add an output for a run
            Parameters
                 id [integer] The ID of the container script.
                 run_id [integer] The ID of the run.
                 object type [string] The type of the output. Valid values are File, Table, Report,
                       Project, Credential, or JSONValue
                 object id [integer] The ID of the output.
            Returns
                 object_type [string] The type of the output. Valid values are File, Table, Report,
                       Project, Credential, or JSONValue
                 object_id [integer] The ID of the output.
                 name [string] The name of the output.
                 link [string] The hypermedia link to the output.
                 value [string]
                                             name='DEFAULT',
post_custom (from_template_id,
                                                                   parent_id='DEFAULT',
                 ments='DEFAULT'.
                                        remote_host_id='DEFAULT',
                                                                         credential id='DEFAULT',
                 schedule='DEFAULT', notifications='DEFAULT', time zone='DEFAULT', hid-
                 den='DEFAULT', target project id='DEFAULT')
      Create a Custom Script
            Parameters
                 from template id [integer] The ID of the template script.
                 name [string, optional] The name of the script.
                 parent id [integer, optional] The ID of the parent job that will trigger this script
                 arguments [dict, optional] Parameter-value pairs to use when running this script.
                       Only settable if this script has defined parameters.
                 remote host id [integer, optional] The remote host ID that this script will connect to.
                 credential_id [integer, optional] The credential that this script will use.
                 schedule [dict, optional::]
                           • scheduled [boolean] If the item is scheduled.
                           • scheduled_days [list] Day based on numeric value starting at 0 for Sun-
                                   day.
```

6.5. API Client 485

• scheduled\_hours [list] Hours of the day it is scheduled on.

- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

**time\_zone** [string, optional] The time zone of this script.

hidden [boolean, optional] The hidden status of the item.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

#### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g Custom)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished. **category** [string]

**projects** [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

ui\_report\_url [integer] The url of the custom HTML.

ui\_report\_id [integer] The id of the report with the custom HTML.

ui\_report\_provide\_api\_key [boolean] Whether the ui report requests an API Key from the report viewer.

**template\_script\_name** [string] The name of the template script.

template\_note [string] The template's note.

**remote\_host\_id** [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success email subject [string] Custom subject line for success e-mail.

- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

time\_zone [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

target\_project\_id [integer] Target project to which script outputs will be added.

```
\begin{tabular}{ll} {\tt post\_custom\_clone}\ (id, & *, & clone\_schedule='DEFAULT', & clone\_triggers='DEFAULT', \\ & clone\_notifications='DEFAULT') \end{tabular}
```

Clone this Custom Script

### **Parameters**

id [integer] The ID for the script.

clone\_schedule [boolean, optional] If true, also copy the schedule to the new script.clone\_triggers [boolean, optional] If true, also copy the triggers to the new script.clone\_notifications [boolean, optional] If true, also copy the notifications to the new script.

#### Returns

```
id [integer] The ID for the script.name [string] The name of the script.type [string] The type of the script (e.g Custom)created at [string/time] The time this script was created.
```

updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

finished\_at [string/time] The time that the script's last run finished. category [string]

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this scriptparams [list::] A definition of the parameters this script accepts in the arguments field.- name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- **type** [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

ui\_report\_url [integer] The url of the custom HTML.

ui\_report\_id [integer] The id of the report with the custom HTML.

ui\_report\_provide\_api\_key [boolean] Whether the ui report requests an API Key
from the report viewer.

**template script name** [string] The name of the template script.

template\_note [string] The template's note.
remote\_host\_id [integer] The remote host ID that this script will connect to.
credential\_id [integer] The credential that this script will use.
code\_preview [string] The code that this script will run with arguments inserted.
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the iob fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

### running as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**time\_zone** [string] The time zone of this script.

# last\_run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- started at [string/time] The time that the run started.

```
• finished at [string/time] The time that the run completed.
                            • error [string] The error message for this run, if present.
                  hidden [boolean] The hidden status of the item.
                  archived [string] The archival status of the requested item(s).
                  target_project_id [integer] Target project to which script outputs will be added.
post custom runs (id)
      Start a run
            Parameters
                  id [integer] The ID of the custom.
            Returns
                  id [integer] The ID of the run.
                  custom id [integer] The ID of the custom.
                  state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                        'cancelled'.
                  is_cancel_requested [boolean] True if run cancel requested, else false.
                  started_at [string/time] The time the last run started at.
                  finished at [string/time] The time the last run completed.
                  error [string] The error, if any, returned by the run.
post_custom_runs_outputs (id, run_id, object_type, object_id)
      Add an output for a run
           Parameters
                  id [integer] The ID of the custom script.
                  run id [integer] The ID of the run.
                  object type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object_id [integer] The ID of the output.
            Returns
                  object type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
post_javascript (name, source, remote_host_id, credential_id, *, parent_id='DEFAULT',
                       user context='DEFAULT', params='DEFAULT', arguments='DEFAULT',
                       schedule='DEFAULT', notifications='DEFAULT', next_run_at='DEFAULT',
                       time zone='DEFAULT', hidden='DEFAULT', target project id='DEFAULT')
     Create a JavaScript Script
            Parameters
                  name [string] The name of the script.
                  source [string] The body/text of the script.
                  remote host id [integer] The remote host ID that this script will connect to.
                  credential id [integer] The credential that this script will use.
                  parent_id [integer, optional] The ID of the parent job that will trigger this script
                  user_context [string, optional] "runner" or "author", who to execute the script as
                        when run as a template.
                  params [list, optional::] A definition of the parameters this script accepts in the argu-
                        ments field. - name: string
                              The variable's name as used within your code.
```

6.5. API Client 491

• label [string] The label to present to users when asking them for the value.

- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters. **schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

```
next_run_at [string/time, optional] The time of the next scheduled run.
```

**time\_zone** [string, optional] The time zone of this script.

**hidden** [boolean, optional] The hidden status of the item.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

finished\_at [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- **allowed\_values** [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an

array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from template id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

#### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.

```
• online [boolean] Whether this user is online.
                  next run at [string/time] The time of the next scheduled run.
                  time zone [string] The time zone of this script.
                  last run [dict::]
                             • id : integer
                             • state: string
                             • created at [string/time] The time that the run was queued.
                             • started_at [string/time] The time that the run started.
                             • finished_at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  hidden [boolean] The hidden status of the item.
                  target_project_id [integer] Target project to which script outputs will be added.
                  archived [string] The archival status of the requested item(s).
                  source [string] The body/text of the script.
                  remote host id [integer] The remote host ID that this script will connect to.
                  credential id [integer] The credential that this script will use.
post_javascript_clone(id,
                                     *, clone schedule='DEFAULT', clone triggers='DEFAULT',
                                 clone_notifications='DEFAULT')
      Clone this JavaScript Script
            Parameters
                  id [integer] The ID for the script.
                  clone schedule [boolean, optional] If true, also copy the schedule to the new script.
                  clone triggers [boolean, optional] If true, also copy the triggers to the new script.
                  clone notifications [boolean, optional] If true, also copy the notifications to the new
                        script.
            Returns
                  id [integer] The ID for the script.
                  name [string] The name of the script.
                  type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
                  created_at [string/time] The time this script was created.
                  updated_at [string/time] The time the script was last updated.
                  author [dict::]
                             • id [integer] The ID of this user.
                             • name [string] This user's name.
                             • username [string] This user's username.
                             • initials [string] This user's initials.
                             • online [boolean] Whether this user is online.
                  state [string] The status of the script's last run.
```

The ID for the project.

category [string] The category of the script.

• name [string] The name of the project.

**finished at** [string/time] The time that the script's last run finished.

projects [list::] A list of projects containing the script. - id : integer

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next run at** [string/time] The time of the next scheduled run.

**time zone** [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target project id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

**source** [string] The body/text of the script.

**remote host id** [integer] The remote host ID that this script will connect to.

credential id [integer] The credential that this script will use.

# post\_javascript\_git\_commits(id, content, message, file\_hash)

Commit and push a new version of the file

### **Parameters**

id [integer] The ID of the file.

**content** [string] The contents to commit to the file.

message [string] A commit message describing the changes being made.

**file\_hash** [string] The full SHA of the file being replaced.

# Returns

**content** [string] The file's contents.

**type** [string] The file's type.

**size** [integer] The file's size.

file hash [string] The SHA of the file.

```
post_javascript_runs(id)
      Start a run
           Parameters
                 id [integer] The ID of the javascript.
            Returns
                 id [integer] The ID of the run.
                 javascript id [integer] The ID of the javascript.
                 state [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or
                        'cancelled'.
                 is_cancel_requested [boolean] True if run cancel requested, else false.
                 started_at [string/time] The time the last run started at.
                 finished_at [string/time] The time the last run completed.
                 error [string] The error, if any, returned by the run.
post_javascript_runs_outputs (id, run_id, object_type, object_id)
      Add an output for a run
            Parameters
                 id [integer] The ID of the javascript script.
                 run id [integer] The ID of the run.
                 object type [string] The type of the output. Valid values are File, Table, Report,
                       Project, Credential, or JSONValue
                 object_id [integer] The ID of the output.
            Returns
                 object type [string] The type of the output. Valid values are File, Table, Report,
                       Project, Credential, or JSONValue
                 object id [integer] The ID of the output.
                 name [string] The name of the output.
                 link [string] The hypermedia link to the output.
                 value [string]
                                               parent_id='DEFAULT',
post_python3 (name,
                                                                          user_context='DEFAULT',
                             source.
                  params='DEFAULT',
                                          arguments='DEFAULT', schedule='DEFAULT', notifi-
                  cations='DEFAULT', next_run_at='DEFAULT', time_zone='DEFAULT', hid-
                  den='DEFAULT', target_project_id='DEFAULT', required_resources='DEFAULT',
                  instance_type='DEFAULT', cancel_timeout='DEFAULT')
     Create a Python Script
            Parameters
                 name [string] The name of the script.
                 source [string] The body/text of the script.
                 parent id [integer, optional] The ID of the parent job that will trigger this script
                 user_context [string, optional] "runner" or "author", who to execute the script as
                       when run as a template.
                 params [list, optional::] A definition of the parameters this script accepts in the argu-
                       ments field. - name: string
                             The variable's name as used within your code.
                           • label [string] The label to present to users when asking them for the value.
                           • description [string] A short sentence or fragment describing this param-
```

multi\_line\_string, integer, float, bool, file, database, credential\_aws,

credential\_redshift, or credential\_custom

• **type** [string] The type of parameter.

eter to the end user.

• required [boolean] Whether this param is required.

Valid options:

- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**next run at** [string/time, optional] The time of the next scheduled run.

time\_zone [string, optional] The time zone of this script.

**hidden** [boolean, optional] The hidden status of the item.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

required\_resources [dict, optional::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string, optional] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**cancel\_timeout** [integer, optional] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

#### **Returns**

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

user\_context [string] "runner" or "author", who to execute the script as when run as
a template.

**params** [list::] A definition of the parameters this script accepts in the arguments field.
- name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.

- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.

- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next\_run\_at** [string/time] The time of the next scheduled run.

**time\_zone** [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**source** [string] The body/text of the script.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

Clone this Python Script

#### **Parameters**

id [integer] The ID for the script.

clone\_schedule [boolean, optional] If true, also copy the schedule to the new script.clone\_triggers [boolean, optional] If true, also copy the triggers to the new script.clone\_notifications [boolean, optional] If true, also copy the notifications to the new script.

Returns

```
id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created_at [string/time] The time this script was created.
updated_at [string/time] The time the script was last updated.
author [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script
user\_context [string] "runner" or "author", who to execute the script as when run as
a template.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

is\_template [boolean] Whether others scripts use this one as a template.published\_as\_template\_id [integer] The ID of the template that this script is backing.

from\_template\_id [integer] The ID of the template this script uses, if any.
template\_dependents\_count [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

#### running as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

last\_run [dict::]

• id : integer

- state: string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target project id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**source** [string] The body/text of the script.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

## post\_python3\_git\_commits (id, content, message, file\_hash)

Commit and push a new version of the file

#### **Parameters**

id [integer] The ID of the file.

**content** [string] The contents to commit to the file.

message [string] A commit message describing the changes being made.

**file\_hash** [string] The full SHA of the file being replaced.

## Returns

**content** [string] The file's contents.

type [string] The file's type.

size [integer] The file's size.

file\_hash [string] The SHA of the file.

## post\_python3\_runs(id)

Start a run

#### **Parameters**

id [integer] The ID of the python.

#### Returns

id [integer] The ID of the run.

**python\_id** [integer] The ID of the python.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

started\_at [string/time] The time the last run started at.

**finished at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

```
post_python3_runs_outputs (id, run_id, object_type, object_id)
      Add an output for a run
           Parameters
                  id [integer] The ID of the python script.
                  run id [integer] The ID of the run.
                  object type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object id [integer] The ID of the output.
            Returns
                  object_type [string] The type of the output. Valid values are File, Table, Report,
                        Project, Credential, or JSONValue
                  object_id [integer] The ID of the output.
                  name [string] The name of the output.
                  link [string] The hypermedia link to the output.
                  value [string]
```

post\_r (name, source, \*, parent\_id='DEFAULT', user\_context='DEFAULT', params='DEFAULT', schedule='DEFAULT', notifications='DEFAULT', arguments='DEFAULT', next run at='DEFAULT', time zone='DEFAULT'. hidden='DEFAULT'. get\_project\_id='DEFAULT', required\_resources='DEFAULT', instance\_type='DEFAULT', cancel timeout='DEFAULT') Create an R Script

**Parameters** 

**name** [string] The name of the script.

source [string] The body/text of the script.

parent\_id [integer, optional] The ID of the parent job that will trigger this script

user context [string, optional] "runner" or "author", who to execute the script as when run as a template.

params [list, optional::] A definition of the parameters this script accepts in the arguments field. - name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: multi line string, integer, float, bool, file, database, credential aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

arguments [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

## schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**next\_run\_at** [string/time, optional] The time of the next scheduled run.

time\_zone [string, optional] The time zone of this script.

hidden [boolean, optional] The hidden status of the item.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

## required\_resources [dict, optional::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string, optional] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**cancel\_timeout** [integer, optional] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

#### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.
template dependents count [integer] How many other scripts use this one as a tem-

**nplate\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

last run [dict::]

- id: integer
- state: string
- created\_at [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

required resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- disk\_space [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**source** [string] The body/text of the script.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

#### **Parameters**

id [integer] The ID for the script.

**clone\_schedule** [boolean, optional] If true, also copy the schedule to the new script.

**clone\_triggers** [boolean, optional] If true, also copy the triggers to the new script.

**clone\_notifications** [boolean, optional] If true, also copy the notifications to the new script.

#### Returns

id [integer] The ID for the script.name [string] The name of the script.

**type** [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)

**created at** [string/time] The time this script was created.

updated\_at [string/time] The time the script was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.

- name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled hours [list] Hours of the day it is scheduled on.

- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

#### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**next\_run\_at** [string/time] The time of the next scheduled run. **time zone** [string] The time zone of this script.

last run [dict::]

- id: integer
- state: string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

required\_resources [dict::]

• **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.

```
• memory [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
```

• **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

source [string] The body/text of the script.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

## post\_r\_git\_commits (id, content, message, file\_hash)

Commit and push a new version of the file

#### **Parameters**

id [integer] The ID of the file.

**content** [string] The contents to commit to the file.

message [string] A commit message describing the changes being made.

**file\_hash** [string] The full SHA of the file being replaced.

#### Returns

**content** [string] The file's contents.

**type** [string] The file's type.

size [integer] The file's size.

**file\_hash** [string] The SHA of the file.

## post\_r\_runs(id)

Start a run

## **Parameters**

**id** [integer] The ID of the r.

#### Returns

id [integer] The ID of the run.

**r\_id** [integer] The ID of the r.

**state** [string] The state of the run, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**is\_cancel\_requested** [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started at.

**finished at** [string/time] The time the last run completed.

**error** [string] The error, if any, returned by the run.

#### post r runs outputs (id, run id, object type, object id)

Add an output for a run

## **Parameters**

id [integer] The ID of the r script.

run\_id [integer] The ID of the run.

object\_type [string] The type of the output. Valid values are File, Table, Report, Project, Credential, or JSONValue

**object\_id** [integer] The ID of the output.

## Returns

**object\_type** [string] The type of the output. Valid values are File, Table, Report, Project, Credential, or JSONValue

object\_id [integer] The ID of the output.

**name** [string] The name of the output.

**link** [string] The hypermedia link to the output.

Create a SQL script

#### **Parameters**

**name** [string] The name of the script.

sql [string] The raw SQL query for the script.

**remote\_host\_id** [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

parent\_id [integer, optional] The ID of the parent job that will trigger this script
user\_context [string, optional] "runner" or "author", who to execute the script as
 when run as a template.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**schedule** [dict, optional::]

- **scheduled** [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.

- **scheduled\_hours** [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success email subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

next\_run\_at [string/time, optional] The time of the next scheduled run.

time\_zone [string, optional] The time zone of this script.

**hidden** [boolean, optional] The hidden status of the item.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

csv\_settings [dict, optional::]

- **include\_header** [boolean] Whether or not to include headers in the output data. Default: true
- **compression** [string] The type of compression to use, if any, one of "none", "zip", or "gzip". Default: gzip
- **column\_delimiter** [string] Which delimiter to use, one of "comma", "tab", or "pipe". Default: comma
- unquoted [boolean] Whether or not to quote fields. Default: false
- **force\_multifile** [boolean] Whether or not the csv should be split into multiple files. Default: false
- filename\_prefix [string] A user specified filename prefix for the output file to have. Default: null

### Returns

```
id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created_at [string/time] The time this script was created.
updated_at [string/time] The time the script was last updated.
author [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

• **details** [string] The details link to get more information about the script.

- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

#### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next\_run\_at** [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

## last\_run [dict::]

- id: integer
- state : string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished at** [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

sql [string] The raw SQL query for the script.

**expanded\_arguments** [dict] Expanded arguments for use in injecting into different environments.

 ${\bf remote\_host\_id} \ \ [{\bf integer}] \ The \ remote \ host \ ID \ that \ this \ script \ will \ connect \ to.$ 

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
csv\_settings [dict::]

- **include\_header** [boolean] Whether or not to include headers in the output data. Default: true
- **compression** [string] The type of compression to use, if any, one of "none", "zip", or "gzip". Default: gzip
- **column\_delimiter** [string] Which delimiter to use, one of "comma", "tab", or "pipe". Default: comma
- unquoted [boolean] Whether or not to quote fields. Default: false
- **force\_multifile** [boolean] Whether or not the csv should be split into multiple files. Default: false
- filename\_prefix [string] A user specified filename prefix for the output file to have. Default: null

#### **Parameters**

id [integer] The ID for the script.

clone\_schedule [boolean, optional] If true, also copy the schedule to the new script.clone\_triggers [boolean, optional] If true, also copy the triggers to the new script.clone\_notifications [boolean, optional] If true, also copy the notifications to the new script.

#### **Returns**

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - **scheduled\_hours** [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next run at** [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state : string
- created at [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- **finished at** [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

sql [string] The raw SQL query for the script.

**expanded\_arguments** [dict] Expanded arguments for use in injecting into different environments.

**remote\_host\_id** [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
csv\_settings [dict::]

• **include\_header** [boolean] Whether or not to include headers in the output data. Default: true

```
• compression [string] The type of compression to use, if any, one of "none", "zip", or "gzip". Default: gzip
```

- **column\_delimiter** [string] Which delimiter to use, one of "comma", "tab", or "pipe". Default: comma
- unquoted [boolean] Whether or not to quote fields. Default: false
- **force\_multifile** [boolean] Whether or not the csv should be split into multiple files. Default: false
- filename\_prefix [string] A user specified filename prefix for the output file to have. Default: null

```
post_sql_git_commits(id, content, message, file_hash)
```

Commit and push a new version of the file

#### **Parameters**

id [integer] The ID of the file.

**content** [string] The contents to commit to the file.

message [string] A commit message describing the changes being made.

file\_hash [string] The full SHA of the file being replaced.

#### Returns

**content** [string] The file's contents.

type [string] The file's type.

size [integer] The file's size.

file\_hash [string] The SHA of the file.

## post\_sql\_runs(id)

Start a run

## **Parameters**

id [integer] The ID of the sql.

## Returns

id [integer] The ID of this run.

sql\_id [integer] The ID of this sql.

state [string] The state of this run.

is\_cancel\_requested [boolean] True if run cancel requested, else false.

**started\_at** [string/time] The time the last run started.

**finished\_at** [string/time] The time that this run finished.

**error** [string] The error message for this run, if present.

**output** [list::] A list of the outputs of this script. - output\_name : string

The name of the output file.

- file id [integer] The unique ID of the output file.
- path [string] The temporary link to download this output file, valid for 36 hours.

```
put_containers (id, required_resources, docker_image_name,
                                                              *, name='DEFAULT', par-
                  ent_id='DEFAULT',
                                         user_context='DEFAULT',
                                                                     params='DEFAULT',
                  arguments='DEFAULT',
                                                  schedule='DEFAULT',
                                                                                 notifica-
                  tions='DEFAULT',
                                        repo_http_uri='DEFAULT',
                                                                    repo_ref='DEFAULT',
                                                             git_credential_id='DEFAULT',

```

Edit a container

## **Parameters**

id [integer] The ID for the script.

## required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB).
- disk\_space [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.
- whole\_instance [boolean] Whether or not to use the entire instance. If true, cpu, memory, and disk space are not required and will be set to an instance's max.

**docker\_image\_name** [string] The name of the docker image to pull from DockerHub. **name** [string, optional] The name of the container.

parent\_id [integer, optional] The ID of the parent job that will trigger this script
user\_context [string, optional] "runner" or "author", who to execute the script as
 when run as a template.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters. **schedule** [dict, optional::]

- **scheduled** [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.

• **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.
- **repo\_http\_uri** [string, optional] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.
- **repo\_ref** [string, optional] The tag or branch of the github repo to clone into the container.
- **remote\_host\_credential\_id** [integer, optional] The id of the database credentials to pass into the environment of the container.
- **git\_credential\_id** [integer, optional] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.
- **docker\_command** [string, optional] The command to run on the container. Will be run via sh as: ["sh", "-c", dockerCommand].
- **docker\_image\_tag** [string, optional] The tag of the docker image to pull from DockerHub (default: latest).
- **instance\_type** [string, optional] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.
- cancel\_timeout [integer, optional] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

**time\_zone** [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

### Returns

```
id [integer] The ID for the script.
name [string] The name of the container.
type [string] The type of the script (e.g Container)
created_at [string/time] The time this script was created.
updated_at [string/time] The time the script was last updated.
author [dict::]
```

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

• **details** [string] The details link to get more information about the script.

- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

#### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

## required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB).
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**repo\_http\_uri** [string] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.

**repo\_ref** [string] The tag or branch of the github repo to clone into the container.

**remote\_host\_credential\_id** [integer] The id of the database credentials to pass into the environment of the container.

**git\_credential\_id** [integer] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.

**docker\_command** [string] The command to run on the container. Will be run via sh as: ["sh", "-c", dockerCommand].

docker\_image\_name [string] The name of the docker image to pull from DockerHub.
docker\_image\_tag [string] The tag of the docker image to pull from DockerHub (default: latest).

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**cancel\_timeout** [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

### last\_run [dict::]

- id: integer
- state : string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**time\_zone** [string] The time zone of this script.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

target\_project\_id [integer] Target project to which script outputs will be added.

## put\_containers\_archive (id, status)

Update the archive status of this object

#### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

#### Returns

id [integer] The ID for the script.

**name** [string] The name of the container.

**type** [string] The type of the script (e.g Container)

created\_at [string/time] The time this script was created.

updated\_at [string/time] The time the script was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.

- name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

**template\_script\_name** [string] The name of the template script.

links [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled hours [list] Hours of the day it is scheduled on.

- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

#### required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB).
- disk\_space [number/float] The amount of disk space, in GB, to allocate
  for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or
  /data. Fractional values (e.g. 0.25) are supported.
- **repo\_http\_uri** [string] The location of a github repo to clone into the container, e.g. github.com/my-user/my-repo.git.
- **repo\_ref** [string] The tag or branch of the github repo to clone into the container.
- **remote\_host\_credential\_id** [integer] The id of the database credentials to pass into the environment of the container.
- **git\_credential\_id** [integer] The id of the git credential to be used when checking out the specified git repo. If not supplied, the first git credential you've submitted will be used. Unnecessary if no git repo is specified or the git repo is public.

```
docker command [string] The command to run on the container. Will be run via sh
                        as: ["sh", "-c", dockerCommand].
                  docker image name [string] The name of the docker image to pull from DockerHub.
                  docker_image_tag [string] The tag of the docker image to pull from DockerHub (de-
                        fault: latest).
                  instance type [string] The EC2 instance type to deploy to. Only available for jobs
                        running on kubernetes.
                  cancel timeout [integer] The amount of time (in seconds) to wait before forcibly ter-
                        minating the script. When the script is cancelled, it is first sent a TERM signal.
                        If the script is still running after the timeout, it is sent a KILL signal. Defaults to
                  last_run [dict::]
                            • id: integer
                            • state: string
                            • created_at [string/time] The time that the run was queued.
                            • started at [string/time] The time that the run started.
                            • finished at [string/time] The time that the run completed.
                            • error [string] The error message for this run, if present.
                  time zone [string] The time zone of this script.
                  hidden [boolean] The hidden status of the item.
                  archived [string] The archival status of the requested item(s).
                  target_project_id [integer] Target project to which script outputs will be added.
put_containers_projects (id, project_id)
      Add a container docker to a project
            Parameters
                  id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_containers_shares_groups (id,
                                                           group_ids,
                                                                                    permission_level,
                                                                      share_email_body='DEFAULT',
                                          send shared email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
```

```
writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                      – name : string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put containers shares users (id,
                                                           user ids,
                                                                                    permission level,
                                                                      share_email_body='DEFAULT',
                                        send_shared_email='DEFAULT')
     Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer

- id: integer

- name : string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

#### **Parameters**

id [integer] The ID for the script.

**name** [string, optional] The name of the script.

parent\_id [integer, optional] The ID of the parent job that will trigger this scriptarguments [dict, optional] Parameter-value pairs to use when running this script.Only settable if this script has defined parameters.

remote\_host\_id [integer, optional] The remote host ID that this script will connect to.
credential\_id [integer, optional] The credential that this script will use.
schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.

- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

**time\_zone** [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

#### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g Custom)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string]

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- **allowed\_values** [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an

array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

is\_template [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from template id [integer] The ID of the template script.

ui report url [integer] The url of the custom HTML.

ui\_report\_id [integer] The id of the report with the custom HTML.

ui\_report\_provide\_api\_key [boolean] Whether the ui report requests an API Key from the report viewer.

template\_script\_name [string] The name of the template script.

**template\_note** [string] The template's note.

**remote host id** [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

## notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- **failure\_on** [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.

- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**time\_zone** [string] The time zone of this script.

last run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

target\_project\_id [integer] Target project to which script outputs will be added.

## put\_custom\_archive (id, status)

Update the archive status of this object

## **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

## Returns

id [integer] The ID for the script.

**name** [string] The name of the script.

**type** [string] The type of the script (e.g Custom)

created\_at [string/time] The time this script was created.

 ${\bf updated\_at} \ \ [{\it string/time}] \ The \ time \ the \ {\it script} \ was \ last \ updated.$ 

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string]

projects [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

**params** [list::] A definition of the parameters this script accepts in the arguments field.

- name: string

The variable's name as used within your code.

• label [string] The label to present to users when asking them for the value.

- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template script.

ui report url [integer] The url of the custom HTML.

**ui report id** [integer] The id of the report with the custom HTML.

ui\_report\_provide\_api\_key [boolean] Whether the ui report requests an API Key from the report viewer.

template\_script\_name [string] The name of the template script.

template\_note [string] The template's note.

remote\_host\_id [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.

- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

time\_zone [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state: string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

**archived** [string] The archival status of the requested item(s).

target\_project\_id [integer] Target project to which script outputs will be added.

```
put_custom_projects (id, project_id)
```

Add a Job to a project

#### **Parameters**

id [integer] The ID of the resource.

**project id** [integer] The ID of the project.

#### Returns

**None** Response code 204: success

```
{\tt put\_custom\_shares\_groups}~(id,
```

group\_ids,

permission\_level,

. . .

share\_email\_body='DEFAULT',

send\_shared\_email='DEFAULT')
Set the permissions groups has on this object

# Parameters

id [integer] The ID of the resource that is shared.

group\_ids [list] An array of one or more group IDs.

permission\_level [string] Options are: "read", "write", or "manage".

**share\_email\_body** [string, optional] Custom body text for e-mail sent on a share.

send\_shared\_email [boolean, optional] Send email to the recipients of a share.

Returns

```
readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name : string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name : string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put_custom_shares_users (id, user_ids, permission_level, *, share_email_body='DEFAULT',
                                   send_shared_email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send shared email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
```

# writers [dict::] • users [list::] - id: integer - name: string • groups [list::] - id: integer - name: string owners [dict::] • users [list::] - id: integer - name: string • groups [list::] - id: integer

total\_user\_shares [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

total\_group\_shares [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

```
put javascript (id, name, source, remote host id, credential id, *, parent id='DEFAULT',

     Replace all attributes of this JavaScript Script
```

name : string

# **Parameters**

id [integer] The ID for the script. **name** [string] The name of the script. **source** [string] The body/text of the script. **remote\_host\_id** [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

parent\_id [integer, optional] The ID of the parent job that will trigger this script user\_context [string, optional] "runner" or "author", who to execute the script as when run as a template.

params [list, optional::] A definition of the parameters this script accepts in the arguments field. - name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.

- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**next\_run\_at** [string/time, optional] The time of the next scheduled run.

**time\_zone** [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

### Returns

id [integer] The ID for the script.name [string] The name of the script.

type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)

created\_at [string/time] The time this script was created.

updated\_at [string/time] The time the script was last updated.

### author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent: defaults to "Civis."
- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

## running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

### last\_run [dict::]

- id: integer
- state : string
- **created\_at** [string/time] The time that the run was queued.
- started at [string/time] The time that the run started.
- **finished at** [string/time] The time that the run completed.

• error [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

**source** [string] The body/text of the script.

remote\_host\_id [integer] The remote host ID that this script will connect to.

**credential id** [integer] The credential that this script will use.

### put javascript archive(id, status)

Update the archive status of this object

### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

#### Returns

id [integer] The ID for the script.

**name** [string] The name of the script.

type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)

created\_at [string/time] The time this script was created.

updated\_at [string/time] The time the script was last updated.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

parent id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.

- name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.

- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

```
running as [dict::]

                  credential id [integer] The credential that this script will use.
put_javascript_git (id, *, git_ref='DEFAULT', git_branch='DEFAULT', git_path='DEFAULT',
                            git_repo_url='DEFAULT')
      Attach this scripted sql to a git repo/file
            Parameters
                  id [integer] The ID of the file.
                  git ref [string, optional] A git reference specifying an unambiguous version of the
                        file. Can be a branch name, or the full or shortened SHA of a commit.
                  git_branch [string, optional] The git branch that the file is on.
                  git_path [string, optional] The path of the file in the repository.
                  git_repo_url [string, optional] The URL of the git repository.
            Returns
                  git ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git_branch [string] The git branch that the file is on.
                  git_path [string] The path of the file in the repository.
                  git repo [dict::]
                             • id [integer] The ID for this git repository.
                             • repo_url [string] The URL for this git repository.
                             • created_at : string/time
                            • updated_at : string/time
put_javascript_projects (id, project_id)
      Add a scripted sql to a project
            Parameters
                  id [integer] The ID of the resource.
                  project id [integer] The ID of the project.
```

```
Returns
                  None Response code 204: success
put_javascript_shares_groups (id,
                                                                                   permission_level,
                                                          group_ids,
                                                                    share_email_body='DEFAULT',
                                         send_shared_email='DEFAULT')
     Set the permissions groups has on this object
           Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                           • users [list::]
                                     - id: integer
                                     - name : string
                           • groups [list::]
                                     - id: integer
                                     - name: string
                  total user shares [integer] For owners, the number of total users shared. For writers
                       and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.
put_javascript_shares_users (id,
                                                                                   permission_level,
                                                          user_ids,
                                                                    share_email_body='DEFAULT',
                                        send_shared_email='DEFAULT')
     Set the permissions users have on this object
```

6.5. API Client 545

**id** [integer] The ID of the resource that is shared.

**Parameters** 

```
permission_level [string] Options are: "read", "write", or "manage".
                  share email body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     – name : string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer

                  total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
                                                parent_id='DEFAULT',
                                                                          user context='DEFAULT',
put python3 (id,
                       name,
                                source,
                                          arguments='DEFAULT',
                 params='DEFAULT',
                                                                      schedule='DEFAULT'.
                                                                                                 no-
                 tifications='DEFAULT',
                                              next_run_at='DEFAULT',
                                                                             time zone='DEFAULT',
                 target_project_id='DEFAULT',
                                                         required_resources='DEFAULT',
                 stance_type='DEFAULT', cancel_timeout='DEFAULT')
     Replace all attributes of this Python Script
            Parameters
                  id [integer] The ID for the script.
                  name [string] The name of the script.
                  source [string] The body/text of the script.
                  parent_id [integer, optional] The ID of the parent job that will trigger this script
                  user_context [string, optional] "runner" or "author", who to execute the script as
                        when run as a template.
                  params [list, optional::] A definition of the parameters this script accepts in the argu-
                        ments field. - name: string
```

user ids [list] An array of one or more user IDs.

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters. **schedule** [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.

- success on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

**next run at** [string/time, optional] The time of the next scheduled run.

time\_zone [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

required\_resources [dict, optional::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- disk\_space [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string, optional] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

cancel\_timeout [integer, optional] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

#### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

**projects** [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

user\_context [string] "runner" or "author", who to execute the script as when run as
a template.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

• label [string] The label to present to users when asking them for the value.

- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### **notifications** [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent: defaults to "Civis."

- success\_email\_reply\_to [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**next\_run\_at** [string/time] The time of the next scheduled run.

**time zone** [string] The time zone of this script.

last run [dict::]

- id: integer
- state: string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

required\_resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**source** [string] The body/text of the script.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

### put python3 archive(id, status)

Update the archive status of this object

### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

params [list::] A definition of the parameters this script accepts in the arguments field.

- name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- **value** [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from template id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

# running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next run at** [string/time] The time of the next scheduled run.

```
time zone [string] The time zone of this script.
                  last run [dict::]
                             • id: integer
                             • state: string
                             • created at [string/time] The time that the run was queued.
                             • started at [string/time] The time that the run started.
                             • finished at [string/time] The time that the run completed.
                             • error [string] The error message for this run, if present.
                  hidden [boolean] The hidden status of the item.
                  target project id [integer] Target project to which script outputs will be added.
                  archived [string] The archival status of the requested item(s).
                  required_resources [dict::]
                             • cpu [integer] The number of CPU shares to allocate for the container.
                                    Each core has 1024 shares. Must be at least 2 shares.
                             • memory [integer] The amount of RAM to allocate for the container (in
                                    MiB). Must be at least 4 MiB.
                             • disk_space [number/float] The amount of disk space, in GB, to allocate
                                    for the container. This space will be used to hold the git repo config-
                                    ured for the container and anything your container writes to /tmp or
                                    /data. Fractional values (e.g. 0.25) are supported.
                  instance type [string] The EC2 instance type to deploy to. Only available for jobs
                        running on kubernetes.
                  source [string] The body/text of the script.
                  cancel_timeout [integer] The amount of time (in seconds) to wait before forcibly ter-
                        minating the script. When the script is cancelled, it is first sent a TERM signal.
                        If the script is still running after the timeout, it is sent a KILL signal. Defaults to
                        0.
put_python3_git(id, *, git_ref='DEFAULT', git_branch='DEFAULT', git_path='DEFAULT',
                       git_repo_url='DEFAULT')
      Attach this python docker to a git repo/file
            Parameters
                  id [integer] The ID of the file.
                  git ref [string, optional] A git reference specifying an unambiguous version of the
                        file. Can be a branch name, or the full or shortened SHA of a commit.
                  git branch [string, optional] The git branch that the file is on.
                  git path [string, optional] The path of the file in the repository.
                  git_repo_url [string, optional] The URL of the git repository.
            Returns
                  git ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git_branch [string] The git branch that the file is on.
                  git_path [string] The path of the file in the repository.
                  git_repo [dict::]
                             • id [integer] The ID for this git repository.
```

6.5. API Client 553

created\_at : string/timeupdated at : string/time

• repo\_url [string] The URL for this git repository.

```
put_python3_projects (id, project_id)
      Add a python docker to a project
           Parameters
                 id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_python3_shares_groups (id,
                                                         group_ids,
                                                                                    permission level,
                                                                     share_email_body='DEFAULT',
                                     send_shared_email='DEFAULT')
     Set the permissions groups has on this object
           Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share email body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     – name : string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     – name : string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
```

ers and readers, the number of visible groups shared.

```
put_python3_shares_users (id, user_ids, permission_level, *, share_email_body='DEFAULT',
                                   send shared email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                 id [integer] The ID of the resource that is shared.
                 user_ids [list] An array of one or more user IDs.
                 permission_level [string] Options are: "read", "write", or "manage".
                 share_email_body [string, optional] Custom body text for e-mail sent on a share.
                 send shared email [boolean, optional] Send email to the recipients of a share.
            Returns
                 readers [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id: integer
                                     - name: string
                 writers [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id: integer
                                     - name: string
                 owners [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id: integer
                                     - name: string
                 total user shares [integer] For owners, the number of total users shared. For writers
                       and readers, the number of visible users shared.
                 total group shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.
put_r (id, name, source, *, parent_id='DEFAULT', user_context='DEFAULT', params='DEFAULT',
        arguments='DEFAULT',
                                          schedule='DEFAULT',
                                                                          notifications='DEFAULT',
        next run at='DEFAULT', time_zone='DEFAULT', target_project_id='DEFAULT',
        quired_resources='DEFAULT', instance_type='DEFAULT', cancel_timeout='DEFAULT')
     Replace all attributes of this R Script
            Parameters
                 id [integer] The ID for the script.
                 name [string] The name of the script.
                 source [string] The body/text of the script.
                 parent_id [integer, optional] The ID of the parent job that will trigger this script
```

user\_context [string, optional] "runner" or "author", who to execute the script as when run as a template.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters. **schedule** [dict, optional::]

- **scheduled** [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.

- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**next run at** [string/time, optional] The time of the next scheduled run.

time\_zone [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

required\_resources [dict, optional::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- disk\_space [number/float] The amount of disk space, in GB, to allocate
  for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or
  /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string, optional] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**cancel\_timeout** [integer, optional] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

### running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next run at** [string/time] The time of the next scheduled run.

**time zone** [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state : string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

archived [string] The archival status of the requested item(s).

required resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

source [string] The body/text of the script.

cancel\_timeout [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0.

# put\_r\_archive (id, status)

Update the archive status of this object

#### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id : integer

The ID for the project.

• name [string] The name of the project.

**params** [list::] A definition of the parameters this script accepts in the arguments field.
- name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's

or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.

allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled\_hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- stall\_warning\_minutes [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on. running as [dict::]
  - id [integer] The ID of this user.

- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next run at** [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

last run [dict::]

- id: integer
- state: string
- **created\_at** [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

**hidden** [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

required resources [dict::]

- **cpu** [integer] The number of CPU shares to allocate for the container. Each core has 1024 shares. Must be at least 2 shares.
- **memory** [integer] The amount of RAM to allocate for the container (in MiB). Must be at least 4 MiB.
- **disk\_space** [number/float] The amount of disk space, in GB, to allocate for the container. This space will be used to hold the git repo configured for the container and anything your container writes to /tmp or /data. Fractional values (e.g. 0.25) are supported.

**instance\_type** [string] The EC2 instance type to deploy to. Only available for jobs running on kubernetes.

**source** [string] The body/text of the script.

**cancel\_timeout** [integer] The amount of time (in seconds) to wait before forcibly terminating the script. When the script is cancelled, it is first sent a TERM signal. If the script is still running after the timeout, it is sent a KILL signal. Defaults to 0

### **Parameters**

id [integer] The ID of the file.

git\_ref [string, optional] A git reference specifying an unambiguous version of the file. Can be a branch name, or the full or shortened SHA of a commit.

git\_branch [string, optional] The git branch that the file is on.

git\_path [string, optional] The path of the file in the repository.

git\_repo\_url [string, optional] The URL of the git repository.

### **Returns**

git\_ref [string] A git reference specifying an unambiguous version of the file. Can be a branch name, or the full or shortened SHA of a commit.

git\_branch [string] The git branch that the file is on.

git\_path [string] The path of the file in the repository.

git\_repo [dict::]

```
• id [integer] The ID for this git repository.
                            • repo_url [string] The URL for this git repository.
                            • created_at : string/time
                            • updated_at : string/time
put_r_projects (id, project_id)
      Add a r docker to a project
           Parameters
                  id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_r_shares_groups (id, group_ids, permission_level, *, share_email_body='DEFAULT',
                            send_shared_email='DEFAULT')
     Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send shared email [boolean, optional] Send email to the recipients of a share.
           Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name : string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
```

```
total group shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.
                                                                    share email body='DEFAULT',
put_r_shares_users (id,
                                user_ids, permission_level,
                           send_shared_email='DEFAULT')
     Set the permissions users have on this object
           Parameters
                  id [integer] The ID of the resource that is shared.
                  user ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                           • users [list::]
                                     - id: integer
                                     - name: string
                           • groups [list::]
                                     - id: integer
                                     - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                       and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                       ers and readers, the number of visible groups shared.

      Replace all attributes of this SQL script
```

total user shares [integer] For owners, the number of total users shared. For writers

and readers, the number of visible users shared.

### **Parameters**

id [integer] The ID for the script.

name [string] The name of the script.

sql [string] The raw SQL query for the script.

**remote host id** [integer] The remote host ID that this script will connect to.

**credential id** [integer] The credential that this script will use.

parent id [integer, optional] The ID of the parent job that will trigger this script

**user\_context** [string, optional] "runner" or "author", who to execute the script as when run as a template.

**params** [list, optional::] A definition of the parameters this script accepts in the arguments field. - name : string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict, optional] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

**next\_run\_at** [string/time, optional] The time of the next scheduled run.

**time\_zone** [string, optional] The time zone of this script.

target\_project\_id [integer, optional] Target project to which script outputs will be added.

csv\_settings [dict, optional::]

- include\_header [boolean] Whether or not to include headers in the output data. Default: true
- **compression** [string] The type of compression to use, if any, one of "none", "zip", or "gzip". Default: gzip
- **column\_delimiter** [string] Which delimiter to use, one of "comma", "tab", or "pipe". Default: comma
- unquoted [boolean] Whether or not to quote fields. Default: false
- **force\_multifile** [boolean] Whether or not the csv should be split into multiple files. Default: false
- filename\_prefix [string] A user specified filename prefix for the output file to have. Default: null

### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**state** [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

projects [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

parent\_id [integer] The ID of the parent job that will trigger this script

params [list::] A definition of the parameters this script accepts in the arguments field.name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- description [string] A short sentence or fragment describing this parameter to the end user.
- type [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential\_redshift, or credential\_custom
- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- **details** [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - **scheduled\_hours** [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **success\_email\_from\_name** [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure\_on [boolean] If failure email notifications are on.

running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

next\_run\_at [string/time] The time of the next scheduled run.

time\_zone [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state : string
- created at [string/time] The time that the run was queued.
- **started\_at** [string/time] The time that the run started.
- **finished at** [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

sql [string] The raw SQL query for the script.

**expanded\_arguments** [dict] Expanded arguments for use in injecting into different environments.

**remote\_host\_id** [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
csv\_settings [dict::]

• **include\_header** [boolean] Whether or not to include headers in the output data. Default: true

- **compression** [string] The type of compression to use, if any, one of "none", "zip", or "gzip". Default: gzip
- **column\_delimiter** [string] Which delimiter to use, one of "comma", "tab", or "pipe". Default: comma
- unquoted [boolean] Whether or not to quote fields. Default: false
- **force\_multifile** [boolean] Whether or not the csv should be split into multiple files. Default: false
- filename\_prefix [string] A user specified filename prefix for the output file to have. Default: null

### put sql archive (id, status)

Update the archive status of this object

author [dict::]

#### **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

### Returns

id [integer] The ID for the script.
name [string] The name of the script.
type [string] The type of the script (e.g SQL, Container, Python, R, JavaScript)
created\_at [string/time] The time this script was created.
updated\_at [string/time] The time the script was last updated.

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

state [string] The status of the script's last run.

**finished\_at** [string/time] The time that the script's last run finished.

category [string] The category of the script.

**projects** [list::] A list of projects containing the script. - id: integer

The ID for the project.

• name [string] The name of the project.

**params** [list::] A definition of the parameters this script accepts in the arguments field.
- name: string

The variable's name as used within your code.

- label [string] The label to present to users when asking them for the value.
- **description** [string] A short sentence or fragment describing this parameter to the end user.
- **type** [string] The type of parameter. Valid options: string, multi\_line\_string, integer, float, bool, file, database, credential\_aws, credential redshift, or credential custom

- required [boolean] Whether this param is required.
- value [string] The value you would like to set this param to. Setting this value makes this parameter a fixed param.
- **default** [string] If an argument for this parameter is not defined, it will use this default value. Use true, True, t, y, yes, or 1 for true bool's or false, False, f, n, no, or 0 for false bool's. Cannot be used for parameters that are required or a credential type.
- allowed\_values [list] The possible values this parameter can take, effectively making this an enumerable parameter. Allowed values is an array of hashes of the following format: {label: 'Import', 'value': 'import'}

**arguments** [dict] Parameter-value pairs to use when running this script. Only settable if this script has defined parameters.

**is\_template** [boolean] Whether others scripts use this one as a template.

published\_as\_template\_id [integer] The ID of the template that this script is backing.
from\_template\_id [integer] The ID of the template this script uses, if any.

**template\_dependents\_count** [integer] How many other scripts use this one as a template.

**template\_script\_name** [string] The name of the template script. **links** [dict::]

- details [string] The details link to get more information about the script.
- runs [string] The runs link to get the run information list for this script. schedule [dict::]
  - scheduled [boolean] If the item is scheduled.
  - **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
  - scheduled hours [list] Hours of the day it is scheduled on.
  - scheduled\_minutes [list] Minutes of the day it is scheduled on.
  - **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

### notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- success\_email\_from\_name [string] Name from which success emails are sent; defaults to "Civis."
- **success\_email\_reply\_to** [string] Address for replies to success emails; defaults to the author of the job.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.

- **stall\_warning\_minutes** [integer] Stall warning emails will be sent after this amount of minutes.
- success\_on [boolean] If success email notifications are on.
- failure on [boolean] If failure email notifications are on.

running\_as [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**next run at** [string/time] The time of the next scheduled run.

**time\_zone** [string] The time zone of this script.

last\_run [dict::]

- id: integer
- state : string
- created\_at [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

hidden [boolean] The hidden status of the item.

target\_project\_id [integer] Target project to which script outputs will be added.

**archived** [string] The archival status of the requested item(s).

sql [string] The raw SQL query for the script.

**expanded\_arguments** [dict] Expanded arguments for use in injecting into different environments.

**remote\_host\_id** [integer] The remote host ID that this script will connect to.

**credential\_id** [integer] The credential that this script will use.

code\_preview [string] The code that this script will run with arguments inserted.
csv settings [dict::]

- **include\_header** [boolean] Whether or not to include headers in the output data. Default: true
- **compression** [string] The type of compression to use, if any, one of "none", "zip", or "gzip". Default: gzip
- **column\_delimiter** [string] Which delimiter to use, one of "comma", "tab", or "pipe". Default: comma
- unquoted [boolean] Whether or not to quote fields. Default: false
- **force\_multifile** [boolean] Whether or not the csv should be split into multiple files. Default: false
- filename\_prefix [string] A user specified filename prefix for the output file to have. Default: null

**Parameters** 

```
id [integer] The ID of the file.
                  git_ref [string, optional] A git reference specifying an unambiguous version of the
                        file. Can be a branch name, or the full or shortened SHA of a commit.
                  git_branch [string, optional] The git branch that the file is on.
                  git path [string, optional] The path of the file in the repository.
                  git repo url [string, optional] The URL of the git repository.
            Returns
                  git_ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git_branch [string] The git branch that the file is on.
                  git_path [string] The path of the file in the repository.
                  git_repo [dict::]
                            • id [integer] The ID for this git repository.
                            • repo_url [string] The URL for this git repository.
                            • created_at : string/time
                            • updated at : string/time
put_sql_projects (id, project_id)
      Add a scripts to a project
            Parameters
                  id [integer] The ID of the resource.
                  project id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_sql_shares_groups (id, group_ids, permission_level, *, share_email_body='DEFAULT',
                                send shared email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
                                      – name : string
                  writers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
                                      - id: integer
```

```
- name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                      name : string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put_sql_shares_users(id, user_ids, permission_level, *, share_email_body='DEFAULT',
                              send_shared_email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user ids [list] An array of one or more user IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
```

- name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

#### Search

class Search (session\_kwargs, return\_type='civis')

#### **Methods**

#### **Parameters**

query [string, optional] The search query.

**type** [string, optional] The type for the search. It accepts a comma-separated list. Valid arguments are listed on the "GET /search/types" endpoint.

offset [integer, optional] The offset for the search results.

**order** [string, optional] The field on which to order the result set.

**owner** [string, optional] The owner for the search.

**limit** [integer, optional] Defaults to 10. Maximum allowed is 50.

**archived** [string, optional] If specified, return only results with the chosen archived status; either 'true', 'false', or 'all'. Defaults to 'false'.

**last\_run\_state** [string, optional] The last run state of the job being searched for; either: 'queued', 'running', 'succeeded', 'failed', or 'cancelled'.

#### Returns

**total\_results** [integer] The number of items matching the search query. **aggregations** [dict] Aggregations by owner and type for the search results. **results** [list::] The items returned by the search. - score : number/float

The relevance score from the search request.

- **type** [string] The type of the item.
- id [integer] The ID of the item.
- name [string] The name of the item.
- **type\_name** [string] The verbose name of the type.
- updated\_at [string/time] The time the item was last updated.
- owner [string] The owner of the item.
- **use\_count** [integer] The use count of the item, if the item is a template.
- last\_run\_id [integer] The last run id of the item, if the item is a job.
- last\_run\_state [string] The last run state of the item, if the item is a job.
- last\_run\_start [string/time] The last run start time of the item, if the item is a job.

- last\_run\_finish [string/time] The last run finish time of the item, if the item is a job.
- **public** [boolean] The flag that indicates a template is available to all users.
- last\_run\_exception [string] The exception of the item after the last run, if the item is a job.

## list\_types()

List available search types

#### Returns

**type** [string] The name of the item type.

#### **Tables**

```
class Tables (session_kwargs, return_type='civis')
```

#### **Methods**

```
delete_projects (id, project_id)

Remove a table from a project

Parameters

id [integer] The ID of the resource.

project_id [integer] The ID of the project.

Returns

None Response code 204: success

get (id)

Show basic table info

Parameters

id [integer]

Returns
```

id [integer] The ID of the table.

database\_id [integer] The ID of the database.

**schema** [string] The name of the schema containing the table.

**name** [string] Name of the table.

**description** [string] The description of the table, as specified by the table owner

**is\_view** [boolean] True if this table represents a view. False if it represents a regular table.

**row\_count** [integer] The number of rows in the table.

**column\_count** [integer] The number of columns in the table.

**size\_mb** [number/float] The size of the table in megabytes.

**owner** [string] The database username of the table's owner.

distkey [string] The column used as the Amazon Redshift distkey.

**sortkeys** [string] The column used as the Amazon Redshift sortkey.

**refresh\_status** [string] How up-to-date the table's statistics on row counts, null counts, distinct counts, and values distributions are. One of: refreshing, stale, or current.

**last refresh** [string/date-time] The time of the last statistics refresh.

**refresh\_id** [string] The ID of the most recent statistics refresh.

last run [dict::]

• id: integer

- state: string
- **created at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

**primary keys** [list] The primary keys for this table.

**last\_modified\_keys** [list] The columns indicating an entry's modification status for this table.

**ontology\_mapping** [dict] The ontology-key to column-name mapping. See /ontology for the list of valid ontology keys.

#### columns [list::]

- name [string] Name of the column.
- sql\_type [string] SQL type of the column.
- sample\_values [list] A sample of values from the column.
- encoding [string] The compression encoding for this columnSee: <a href="http://docs.aws.amazon.com/red-shift/latest/dg/c\_Compression\_encodings.html">http://docs.aws.amazon.com/red-shift/latest/dg/c\_Compression\_encodings.html</a>
- **description** [string] The description of the column, as specified by the table owner
- order [integer] Relative position of the column in the table.
- min\_value [string] Smallest value in the column.
- max\_value [string] Largest value in the column.
- avg\_value [number/float] Average value of the column, where applicable.
- stddev [number/float] Stddev of the column, where applicable.
- value\_distribution\_percent [dict] A mapping between each value in the
  column and the percentage of rows with that value. Only present
  for tables with fewer than approximately 25,000,000 rows and for
  columns with fewer than twenty distinct values.
- coverage count [integer] Number of non-null values in the column.
- null\_count [integer] Number of null values in the column.
- **possible\_dependent\_variable\_types** [list] Possible dependent variable types the column may be used to model. Null if it may not be used as a dependent variable.
- **useable\_as\_independent\_variable** [boolean] Whether the column may be used as an independent variable to train a model.
- **useable\_as\_primary\_key** [boolean] Whether the column may be used as an primary key to identify table rows.
- value\_distribution [dict] An object mapping distinct values in the column to the number of times they appear in the column
- distinct\_count [integer] Number of distinct values in the column.

## joins [list::]

• id: integer

```
left_table_id: integer
left_identifier: string
right_table_id: integer
right_identifier: string
on: string
left_join: boolean
created_at: string/time
updated_at: string/time
multipart_key [list]
enhancements [list::]
type: string
```

• created\_at : string/time

• updated\_at : string/time

• join\_id: integer

view\_def [string]
table\_def [string]

outgoing\_table\_matches [list::]

- source\_table\_id [integer] Source table
- target\_type [string] Target type
- target\_id [integer] Target ID
- target [dict::]
  - name: string
- **job** [dict::]
  - id: integer
  - name: string
  - type: string
  - from\_template\_id : integer
  - **state** [string] Whether the job is idle, queued, running, cancelled, or failed.
  - created\_at : string/date-time
  - updated\_at : string/date-time
  - runs [list::] Information about the most recent runs of the job.
    - id : integer state : string created\_at : string/time

The time that the run was queued.

- \* **started\_at** [string/time] The time that the run started.
- \* **finished\_at** [string/time] The time that the run completed.
- \* error [string] The error message for this run, if present.

#### - last\_run [dict::]

- \* id: integer
- \* state: string
- \* **created\_at** [string/time] The time that the run was queued.
- \* started at [string/time] The time that the run started.
- \* **finished\_at** [string/time] The time that the run completed.
- \* **error** [string] The error message for this run, if present.
- hidden [boolean] The hidden status of the item.
- match\_options [dict::]
  - \* max\_matches : integer
  - \* threshold : string

#### get\_enhancements\_cass\_ncoa(id, source\_table\_id)

View the status of a CASS / NCOA table enhancement

#### **Parameters**

id [integer] The ID of the enhancement.

**source\_table\_id** [integer] The ID of the table that was enhanced.

#### Returns

id [integer] The ID of the enhancement.

**source\_table\_id** [integer] The ID of the table that was enhanced.

**state** [string] The state of the enhancement, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

enhanced\_table\_schema [string] The schema name of the table created by the enhancement.

**enhanced\_table\_name** [string] The name of the table created by the enhancement.

**perform\_ncoa** [boolean] Whether to update addresses for records matching the National Change of Address (NCOA) database.

**ncoa\_credential\_id** [integer] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.

output\_level [string] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.

## get\_enhancements\_geocodings (id, source\_table\_id)

View the status of a geocoding table enhancement

## **Parameters**

id [integer] The ID of the enhancement.

source\_table\_id [integer] The ID of the table that was enhanced.

#### Returns

id [integer] The ID of the enhancement.

**source table id** [integer] The ID of the table that was enhanced.

**state** [string] The state of the enhancement, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**enhanced\_table\_schema** [string] The schema name of the table created by the enhancement.

**enhanced table name** [string] The name of the table created by the enhancement.

#### get\_enhancements\_prepared\_matchings(id, source\_table\_id)

View a prepared matching enhancement

#### **Parameters**

id [integer] The ID of the enhancement.

**source\_table\_id** [integer] The ID of the table that was enhanced.

#### Returns

id [integer] The ID of the enhancement.

**source table id** [integer] The ID of the table that was enhanced.

**state** [string] The state of the enhancement, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

enhanced\_table\_schema [string] The schema name of the table created by the enhancement.

**enhanced\_table\_name** [string] The name of the table created by the enhancement.

**threshold** [number/float] The confidence threshold which must be met for two individuals to be declared a match. Must be less than or equal to 1 and greater than or equal to 0.

**max\_matches** [integer] The maximum number of individuals a person may be matched with. A value of 0 indicates that all matches should be returned.

match\_table\_id [integer] The ID of the Dynamo table to match against.

# get\_enhancements\_table\_matchings (id, source\_table\_id)

View a table matching enhancement

## **Parameters**

**id** [integer] The ID of the enhancement.

source\_table\_id [integer] The ID of the table that was enhanced.

#### Returns

**id** [integer] The ID of the enhancement.

source\_table\_id [integer] The ID of the table that was enhanced.

**state** [string] The state of the enhancement, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

enhanced\_table\_schema [string] The schema name of the table created by the enhancement.

**enhanced\_table\_name** [string] The name of the table created by the enhancement.

**threshold** [number/float] The confidence threshold which must be met for two individuals to be declared a match. Must be less than or equal to 1 and greater than or equal to 0.

**max\_matches** [integer] The maximum number of individuals a person may be matched with. A value of 0 indicates that all matches should be returned.

match\_table\_id [integer] The ID of the Redshift table to match against.

list (\*, database\_id='DEFAULT', schema='DEFAULT', name='DEFAULT', search='DEFAULT',
 limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', itera tor='DEFAULT')
 List tables

#### **Parameters**

database id [integer, optional] The ID of the database.

schema [string, optional] If specified, will be used to filter the tables returned. Substring matching is supported with "%" and "\*" wildcards (e.g., "schema=%census%" will return both "client\_census.table" and "census 2010.table").

**name** [string, optional] If specified, will be used to filter the tables returned. Substring matching is supported with "%" and "\*" wildcards (e.g., "name=%table%" will return both "table1" and "my table").

**search** [string, optional] If specified, will be used to filter the tables returned. Will search across schema and name (in the full form schema.name) and will return

any full name containing the search string.

**limit** [integer, optional] Number of results to return. Defaults to 50. Maximum allowed is 1000.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to schema. Must be one of: schema, name, search.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

#### Returns

id [integer] The ID of the table.

database\_id [integer] The ID of the database.

**schema** [string] The name of the schema containing the table.

name [string] Name of the table.

description [string] The description of the table, as specified by the table owner

**is\_view** [boolean] True if this table represents a view. False if it represents a regular table.

row\_count [integer] The number of rows in the table.

**column\_count** [integer] The number of columns in the table.

**size\_mb** [number/float] The size of the table in megabytes.

**owner** [string] The database username of the table's owner.

distkey [string] The column used as the Amazon Redshift distkey.

**sortkeys** [string] The column used as the Amazon Redshift sortkey.

**refresh\_status** [string] How up-to-date the table's statistics on row counts, null counts, distinct counts, and values distributions are. One of: refreshing, stale, or current.

**last\_refresh** [string/date-time] The time of the last statistics refresh.

**refresh\_id** [string] The ID of the most recent statistics refresh.

last run [dict::]

- id: integer
- · state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

list\_columns (id, \*, name='DEFAULT', limit='DEFAULT', page\_num='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')
List columns in the specified table

#### **Parameters**

id [integer]

**name** [string, optional] Search for columns with the given name, within the specified table.

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to name. Must be one of: name, order.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

**name** [string] Name of the column.

**sql\_type** [string] SQL type of the column.

sample values [list] A sample of values from the column.

**encoding** [string] The compression encoding for this columnSee: http://docs.aws. amazon.com/redshift/latest/dg/c\_Compression\_encodings.html

**description** [string] The description of the column, as specified by the table owner **order** [integer] Relative position of the column in the table.

min\_value [string] Smallest value in the column.

max\_value [string] Largest value in the column.

avg\_value [number/float] Average value of the column, where applicable.

stddev [number/float] Stddev of the column, where applicable.

**value\_distribution\_percent** [dict] A mapping between each value in the column and the percentage of rows with that value. Only present for tables with fewer than approximately 25,000,000 rows and for columns with fewer than twenty distinct values.

**coverage\_count** [integer] Number of non-null values in the column.

null\_count [integer] Number of null values in the column.

**possible\_dependent\_variable\_types** [list] Possible dependent variable types the column may be used to model. Null if it may not be used as a dependent variable.

**useable\_as\_independent\_variable** [boolean] Whether the column may be used as an independent variable to train a model.

**useable\_as\_primary\_key** [boolean] Whether the column may be used as an primary key to identify table rows.

**value\_distribution** [dict] An object mapping distinct values in the column to the number of times they appear in the column

distinct\_count [integer] Number of distinct values in the column.

## list\_projects (id, \*, hidden='DEFAULT')

List the projects a table belongs to

## **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

## Returns

id [integer] The ID for this project.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

name [string] The name of this project.

description [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

auto\_share [boolean]

created at [string/time]

updated at [string/time]

**archived** [string] The archival status of the requested item(s).

#### **Parameters**

**id** [integer] The ID of the table.

**ontology\_mapping** [dict, optional] The ontology-key to column-name mapping. See /ontology for the list of valid ontology keys.

**description** [string, optional] The user-defined description of the table.

primary\_keys [list, optional] The columns comprising the primary key of this table.
last\_modified\_keys [list, optional] The columns indicating when a row was last modified.

## Returns

id [integer] The ID of the table.

database\_id [integer] The ID of the database.

**schema** [string] The name of the schema containing the table.

name [string] Name of the table.

description [string] The description of the table, as specified by the table owner

**is\_view** [boolean] True if this table represents a view. False if it represents a regular table.

**row\_count** [integer] The number of rows in the table.

**column\_count** [integer] The number of columns in the table.

**size\_mb** [number/float] The size of the table in megabytes.

**owner** [string] The database username of the table's owner.

distkey [string] The column used as the Amazon Redshift distkey.

**sortkeys** [string] The column used as the Amazon Redshift sortkey.

**refresh\_status** [string] How up-to-date the table's statistics on row counts, null counts, distinct counts, and values distributions are. One of: refreshing, stale, or current.

**last\_refresh** [string/date-time] The time of the last statistics refresh.

**refresh id** [string] The ID of the most recent statistics refresh.

last run [dict::]

- id: integer
- state : string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- finished\_at [string/time] The time that the run completed.
- error [string] The error message for this run, if present.

primary\_keys [list] The primary keys for this table.

last\_modified\_keys [list] The columns indicating an entry's modification status for this table. **ontology\_mapping** [dict] The ontology-key to column-name mapping. See /ontology for the list of valid ontology keys.

 $\begin{tabular}{ll} {\tt post\_enhancements\_cass\_ncoa} (source\_table\_id, &*, & perform\_ncoa='DEFAULT', \\ & ncoa\_credential\_id='DEFAULT', output\_level='DEFAULT') \end{tabular}$ 

Standardize addresses in a table

#### **Parameters**

**source\_table\_id** [integer] The ID of the table to be enhanced.

**perform\_ncoa** [boolean, optional] Whether to update addresses for records matching the National Change of Address (NCOA) database.

**ncoa\_credential\_id** [integer, optional] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.

output\_level [string, optional] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.

#### Returns

id [integer] The ID of the enhancement.

source\_table\_id [integer] The ID of the table that was enhanced.

**state** [string] The state of the enhancement, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

enhanced\_table\_schema [string] The schema name of the table created by the enhancement.

enhanced\_table\_name [string] The name of the table created by the enhancement.

**perform\_ncoa** [boolean] Whether to update addresses for records matching the National Change of Address (NCOA) database.

**ncoa\_credential\_id** [integer] Credential to use when performing NCOA updates. Required if 'performNcoa' is true.

output\_level [string] The set of fields persisted by a CASS or NCOA enhancement. For CASS enhancements, one of 'cass' or 'all.' For NCOA enhancements, one of 'cass', 'ncoa', 'coalesced' or 'all'. By default, all fields will be returned.

# post\_enhancements\_geocodings (source\_table\_id)

Geocode a table

#### **Parameters**

source\_table\_id [integer] The ID of the table to be enhanced.

#### Returns

id [integer] The ID of the enhancement.

**source\_table\_id** [integer] The ID of the table that was enhanced.

**state** [string] The state of the enhancement, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

**enhanced\_table\_schema** [string] The schema name of the table created by the enhancement.

**enhanced table name** [string] The name of the table created by the enhancement.

# 

Match person records against a dynamo table prepared by Civis

#### **Parameters**

**source table id** [integer] The ID of the table to be enhanced.

**threshold** [number/float] The confidence threshold which must be met for two individuals to be declared a match. Must be less than or equal to 1 and greater than or equal to 0.

match\_table\_id [integer] The ID of the Dynamo table to match against.

**max\_matches** [integer, optional] The maximum number of individuals a person may be matched with.A value of 0 indicates that all matches should be returned.

#### Returns

**id** [integer] The ID of the enhancement.

**source\_table\_id** [integer] The ID of the table that was enhanced.

**state** [string] The state of the enhancement, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

enhanced\_table\_schema [string] The schema name of the table created by the enhancement.

**enhanced table name** [string] The name of the table created by the enhancement.

**threshold** [number/float] The confidence threshold which must be met for two individuals to be declared a match. Must be less than or equal to 1 and greater than or equal to 0.

**max\_matches** [integer] The maximum number of individuals a person may be matched with. A value of 0 indicates that all matches should be returned.

match\_table\_id [integer] The ID of the Dynamo table to match against.

Match person records against an arbitrary Redshift table

#### **Parameters**

**source\_table\_id** [integer] The ID of the table to be enhanced.

**threshold** [number/float] The confidence threshold which must be met for two individuals to be declared a match. Must be less than or equal to 1 and greater than or equal to 0.

match\_table\_id [integer] The ID of the Redshift table to match against.

**max\_matches** [integer, optional] The maximum number of individuals a person may be matched with. A value of 0 indicates that all matches should be returned.

#### Returns

id [integer] The ID of the enhancement.

**source\_table\_id** [integer] The ID of the table that was enhanced.

**state** [string] The state of the enhancement, one of 'queued' 'running' 'succeeded' 'failed' or 'cancelled'.

enhanced\_table\_schema [string] The schema name of the table created by the enhancement.

**enhanced\_table\_name** [string] The name of the table created by the enhancement.

**threshold** [number/float] The confidence threshold which must be met for two individuals to be declared a match. Must be less than or equal to 1 and greater than or equal to 0.

**max\_matches** [integer] The maximum number of individuals a person may be matched with. A value of 0 indicates that all matches should be returned.

match table id [integer] The ID of the Redshift table to match against.

#### post refresh (id)

Request a refresh for column and table statistics

# **Parameters**

id [integer]

## Returns

id [integer] The ID of the table.

database\_id [integer] The ID of the database.

**schema** [string] The name of the schema containing the table.

name [string] Name of the table.

description [string] The description of the table, as specified by the table owner

**is\_view** [boolean] True if this table represents a view. False if it represents a regular table

**row\_count** [integer] The number of rows in the table.

**column\_count** [integer] The number of columns in the table.

**size\_mb** [number/float] The size of the table in megabytes.

**owner** [string] The database username of the table's owner.

**distkey** [string] The column used as the Amazon Redshift distkey.

sortkeys [string] The column used as the Amazon Redshift sortkey.

**refresh\_status** [string] How up-to-date the table's statistics on row counts, null counts, distinct counts, and values distributions are. One of: refreshing, stale, or current.

**last\_refresh** [string/date-time] The time of the last statistics refresh.

**refresh id** [string] The ID of the most recent statistics refresh.

last\_run [dict::]

- id: integer
- · state: string
- **created\_at** [string/time] The time that the run was queued.
- started\_at [string/time] The time that the run started.
- **finished\_at** [string/time] The time that the run completed.
- **error** [string] The error message for this run, if present.

primary\_keys [list] The primary keys for this table.

last\_modified\_keys [list] The columns indicating an entry's modification status for this table.

**ontology\_mapping** [dict] The ontology-key to column-name mapping. See /ontology for the list of valid ontology keys.

columns [list::]

- name [string] Name of the column.
- sql\_type [string] SQL type of the column.
- sample\_values [list] A sample of values from the column.
- encoding [string] The compression encoding for this columnSee: <a href="http://docs.aws.amazon.com/red-shift/latest/dg/c\_Compression\_encodings.html">http://docs.aws.amazon.com/red-shift/latest/dg/c\_Compression\_encodings.html</a>
- description [string] The description of the column, as specified by the table owner
- order [integer] Relative position of the column in the table.
- min\_value [string] Smallest value in the column.
- max\_value [string] Largest value in the column.
- avg value [number/float] Average value of the column, where applicable.
- stddev [number/float] Stddev of the column, where applicable.
- value\_distribution\_percent [dict] A mapping between each value in the column and the percentage of rows with that value. Only present for tables with fewer than approximately 25,000,000 rows and for columns with fewer than twenty distinct values.
- **coverage\_count** [integer] Number of non-null values in the column.
- null\_count [integer] Number of null values in the column.
- **possible\_dependent\_variable\_types** [list] Possible dependent variable types the column may be used to model. Null if it may not be used as a dependent variable.

- **useable\_as\_independent\_variable** [boolean] Whether the column may be used as an independent variable to train a model.
- **useable\_as\_primary\_key** [boolean] Whether the column may be used as an primary key to identify table rows.
- value\_distribution [dict] An object mapping distinct values in the column to the number of times they appear in the column
- **distinct count** [integer] Number of distinct values in the column.

# joins [list::]

- id: integer
- left\_table\_id : integer
- left\_identifier : string
- right\_table\_id : integer
- right\_identifier : string
- on : string
- left\_join : boolean
- created\_at : string/time
- updated\_at : string/time

# multipart\_key [list] enhancements [list::]

- type : string
- created\_at : string/time
- updated\_at : string/time
- join\_id : integer

view\_def [string]

table\_def [string]

## outgoing\_table\_matches [list::]

- source\_table\_id [integer] Source table
- target\_type [string] Target type
- target\_id [integer] Target ID
- target [dict::]
  - name: string
- **job** [dict::]
  - id: integer
  - name: string
  - type : string
  - from\_template\_id : integer
  - **state** [string] Whether the job is idle, queued, running, cancelled, or failed.
  - created\_at : string/date-time

```
- updated_at : string/date-time
                                           - runs [list::] Information about the most recent runs of the job.
                                                 - id : integer - state : string - created_at : string/time
                                                    The time that the run was queued.
                                                  * started at [string/time] The time that the run started.
                                                  * finished_at [string/time] The time that the run com-
                                                      pleted.
                                                  * error [string] The error message for this run, if present.
                                           - last_run [dict::]
                                                  * id: integer
                                                  * state: string
                                                  * created_at [string/time] The time that the run was
                                                      queued.
                                                  * started_at [string/time] The time that the run started.
                                                  * finished_at [string/time] The time that the run com-
                                                      pleted.
                                                  * error [string] The error message for this run, if present.
                                           – hidden [boolean] The hidden status of the item.
                                           - match_options [dict::]
                                                  * max_matches: integer
                                                  * threshold: string
     put_projects (id, project_id)
            Add a table to a project
                 Parameters
                        id [integer] The ID of the resource.
                        project_id [integer] The ID of the project.
                  Returns
                        None Response code 204: success
Templates
class Templates (session_kwargs, return_type='civis')
     Methods
     delete_reports_shares_groups (id, group_id)
           Revoke the permissions a group has on this object
                 Parameters
                        id [integer] The ID of the resource that is shared.
                        group_id [integer] The ID of the group.
                  Returns
```

```
None Response code 204: success
delete_reports_shares_users (id, user_id)
     Revoke the permissions a user has on this object
            Parameters
                 id [integer] The ID of the resource that is shared.
                 user id [integer] The ID of the user.
            Returns
                 None Response code 204: success
{\tt delete\_scripts\_projects}\ (id, project\_id)
      Remove a Template::Script from a project
            Parameters
                 id [integer] The ID of the resource.
                 project_id [integer] The ID of the project.
            Returns
                 None Response code 204: success
delete_scripts_shares_groups (id, group_id)
     Revoke the permissions a group has on this object
           Parameters
                 id [integer] The ID of the resource that is shared.
                 group_id [integer] The ID of the group.
            Returns
                 None Response code 204: success
delete_scripts_shares_users (id, user_id)
      Revoke the permissions a user has on this object
            Parameters
                 id [integer] The ID of the resource that is shared.
                 user_id [integer] The ID of the user.
            Returns
                 None Response code 204: success
get_reports(id)
      Get a Report Template
            Parameters
                 id [integer]
            Returns
                 id [integer]
                 name [string] The name of the template.
                 category [string] The category of this report template. Can be left blank. Acceptable
                       values are: dataset-viz
                 created at [string/time]
                 updated at [string/time]
                 use_count [integer] The number of uses of this template.
                 archived [boolean] Whether the template has been archived.
                 author [dict::]
                           • id [integer] The ID of this user.
                           • name [string] This user's name.
                           • username [string] This user's username.
                           • initials [string] This user's initials.
                           • online [boolean] Whether this user is online.
```

```
tech reviewed [boolean] Whether this template has been audited by Civis for security
                        vulnerability and correctness.
                  auth code url [string] A URL to the template's stored code body.
                  provide_api_key [boolean] Whether reports based on this template request an API
                        Key from the report viewer.
                  hidden [boolean] The hidden status of the item.
get_scripts(id)
      Get a Script Template
            Parameters
                  id [integer]
            Returns
                  id [integer]
                  script_id [integer] The id of the script that this template uses.
                  user_context [string] The user context of the script that this template uses.
                  name [string] The name of the template.
                  category [string] The category of this template.
                  note [string] A note describing what this template is used for; custom scripts created
                        off this template will display this description.
                  created at [string/time]
                  updated at [string/time]
                  use count [integer] The number of uses of this template.
                  ui report id [integer] The id of the report that this template uses.
                  tech reviewed [boolean] Whether this template has been audited by Civis for security
                        vulnerability and correctness.
                  archived [boolean] Whether the template has been archived.
                  hidden [boolean] The hidden status of the item.
                            hidden='DEFAULT',
                                                       category='DEFAULT',
                                                                                   limit='DEFAULT',
list_reports(*,
                  page_num='DEFAULT',
                                              order='DEFAULT',
                                                                    order_dir='DEFAULT',
                  tor='DEFAULT')
      List Report Templates
            Parameters
                  hidden [boolean, optional] If specified to be true, returns hidden items. Defaults to
                        false, returning non-hidden items.
                  category [string, optional] A category to filter results by, one of: dataset-viz
                  limit [integer, optional] Number of results to return. Defaults to 50. Maximum al-
                        lowed is 1000.
                  page num [integer, optional] Page number of the results to return. Defaults to the first
                        page, 1.
                  order [string, optional] The field on which to order the result set. Defaults to name.
                        Must be one of: name, updated_at, created_at.
                  order_dir [string, optional] Direction in which to sort, either asc (ascending) or desc
                        (descending) defaulting to asc.
                  iterator [bool, optional] If True, return a generator to iterate over all responses. Use
                        when more results than the maximum allowed by limit are needed. When True,
                        limit and page_num are ignored. Defaults to False.
            Returns
                  id [integer]
                  name [string] The name of the template.
                  category [string] The category of this report template. Can be left blank. Acceptable
                        values are: dataset-viz
                  created at [string/time]
                  updated at [string/time]
                  use_count [integer] The number of uses of this template.
```

**archived** [boolean] Whether the template has been archived. **author** [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**tech\_reviewed** [boolean] Whether this template has been audited by Civis for security vulnerability and correctness.

# $list\_reports\_shares(id)$

List users and groups permissioned on this object

#### **Parameters**

id [integer] The ID of the resource that is shared.

## Returns

readers [dict::]

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id: integer
  - name: string

# writers [dict::]

- users [list::]
  - id: integer
  - name : string
- groups [list::]
  - id: integer
  - name: string

## owners [dict::]

- users [list::]
  - id: integer
  - name: string
- groups [list::]
  - id : integername : string
- total\_user\_shares [integer] For owners, the number of total users shared. For writers

and readers, the number of visible users shared. **total\_group\_shares** [integer] For owners, the number of total groups shared. For writ-

ers and readers, the number of visible groups shared.

**List Script Templates** 

#### **Parameters**

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**category** [string, optional] A category to filter results by, one of: import, export, enhancement, model, and script

**limit** [integer, optional] Number of results to return. Defaults to 50. Maximum allowed is 1000.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to name. Must be one of: name, updated\_at, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

id [integer]

**script\_id** [integer] The id of the script that this template uses.

**user\_context** [string] The user context of the script that this template uses.

**name** [string] The name of the template.

category [string] The category of this template.

created\_at [string/time]

updated\_at [string/time]

use\_count [integer] The number of uses of this template.

ui\_report\_id [integer] The id of the report that this template uses.

**tech\_reviewed** [boolean] Whether this template has been audited by Civis for security vulnerability and correctness.

archived [boolean] Whether the template has been archived.

## list\_scripts\_projects (id, \*, hidden='DEFAULT')

List the projects a Template::Script belongs to

## **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

# Returns

id [integer] The ID for this project.
author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of this project.

**description** [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

```
• name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  auto share [boolean]
                  created_at [string/time]
                  updated at [string/time]
                  archived [string] The archival status of the requested item(s).
list_scripts_shares(id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name : string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
                               name='DEFAULT', category='DEFAULT',
                                                                              archived='DEFAULT',
patch_reports(id,
                    code_body='DEFAULT', provide_api_key='DEFAULT')
      Update some attributes of this Report Template
           Parameters
```

```
id [integer]
                  name [string, optional] The name of the template.
                  category [string, optional] The category of this report template. Can be left blank.
                        Acceptable values are: dataset-viz
                  archived [boolean, optional] Whether the template has been archived.
                  code body [string, optional] The code for the Template body.
                  provide api kev [boolean, optional] Whether reports based on this template request
                        an API Key from the report viewer.
            Returns
                  id [integer]
                  name [string] The name of the template.
                  category [string] The category of this report template. Can be left blank. Acceptable
                        values are: dataset-viz
                  created_at [string/time]
                  updated_at [string/time]
                  use_count [integer] The number of uses of this template.
                  archived [boolean] Whether the template has been archived.
                  author [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  tech reviewed [boolean] Whether this template has been audited by Civis for security
                        vulnerability and correctness.
                  auth_code_url [string] A URL to the template's stored code body.
                  provide api key [boolean] Whether reports based on this template request an API
                        Key from the report viewer.
                  hidden [boolean] The hidden status of the item.
                                name='DEFAULT',
patch_scripts(id,
                                                      note='DEFAULT', ui_report_id='DEFAULT',
                    archived='DEFAULT')
      Update some attributes of this Script Template
            Parameters
                  id [integer]
                  name [string, optional] The name of the template.
                  note [string, optional] A note describing what this template is used for; custom scripts
                        created off this template will display this description.
                  ui_report_id [integer, optional] The id of the report that this template uses.
                  archived [boolean, optional] Whether the template has been archived.
            Returns
                  id [integer]
                  script id [integer] The id of the script that this template uses.
                  user_context [string] The user context of the script that this template uses.
                  name [string] The name of the template.
                  category [string] The category of this template.
                  note [string] A note describing what this template is used for; custom scripts created
                        off this template will display this description.
                  created at [string/time]
                  updated at [string/time]
                  use count [integer] The number of uses of this template.
                  ui_report_id [integer] The id of the report that this template uses.
```

```
tech reviewed [boolean] Whether this template has been audited by Civis for security
                        vulnerability and correctness.

                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  tech_reviewed [boolean] Whether this template has been audited by Civis for security
                        vulnerability and correctness.
                  auth_code_url [string] A URL to the template's stored code body.
                  provide api key [boolean] Whether reports based on this template request an API
                        Key from the report viewer.
                  hidden [boolean] The hidden status of the item.
post_reports_review(id, status)
     Review a template for security vulnerability and correctness (admin-only)
            Parameters
                  id [integer] The ID of the item.
                  status [boolean] Whether this item has been reviewed.
            Returns
                  id [integer]
                  name [string] The name of the template.
                  category [string] The category of this report template. Can be left blank. Acceptable
                        values are: dataset-viz
                  created_at [string/time]
                  updated_at [string/time]
                  use_count [integer] The number of uses of this template.
                  archived [boolean] Whether the template has been archived.
```

## author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**tech\_reviewed** [boolean] Whether this template has been audited by Civis for security vulnerability and correctness.

auth\_code\_url [string] A URL to the template's stored code body.

provide\_api\_key [boolean] Whether reports based on this template request an API
Key from the report viewer.

**hidden** [boolean] The hidden status of the item.

#### **Parameters**

**script\_id** [integer] The id of the script that this template uses.

**name** [string] The name of the template.

**note** [string, optional] A note describing what this template is used for; custom scripts created off this template will display this description.

ui\_report\_id [integer, optional] The id of the report that this template uses.

archived [boolean, optional] Whether the template has been archived.

**hidden** [boolean, optional] The hidden status of the item.

#### Returns

id [integer]

**script\_id** [integer] The id of the script that this template uses.

**user\_context** [string] The user context of the script that this template uses.

**name** [string] The name of the template.

category [string] The category of this template.

**note** [string] A note describing what this template is used for; custom scripts created off this template will display this description.

created\_at [string/time]

updated\_at [string/time]

**use\_count** [integer] The number of uses of this template.

ui\_report\_id [integer] The id of the report that this template uses.

**tech\_reviewed** [boolean] Whether this template has been audited by Civis for security vulnerability and correctness.

**archived** [boolean] Whether the template has been archived.

hidden [boolean] The hidden status of the item.

## post\_scripts\_review(id, status)

Review a template for security vulnerability and correctness (admin-only)

#### **Parameters**

id [integer] The ID of the item.

status [boolean] Whether this item has been reviewed.

#### **Returns**

id [integer]

**script\_id** [integer] The id of the script that this template uses.

**user\_context** [string] The user context of the script that this template uses.

name [string] The name of the template.

category [string] The category of this template.

```
off this template will display this description.
                  created at [string/time]
                  updated_at [string/time]
                  use count [integer] The number of uses of this template.
                  ui report id [integer] The id of the report that this template uses.
                  tech reviewed [boolean] Whether this template has been audited by Civis for security
                        vulnerability and correctness.
                  archived [boolean] Whether the template has been archived.
                  hidden [boolean] The hidden status of the item.
put_reports(id, name, code_body, *, category='DEFAULT', archived='DEFAULT', pro-
                 vide api key='DEFAULT')
      Replace all attributes of this Report Template
            Parameters
                  id [integer]
                  name [string] The name of the template.
                  code_body [string] The code for the Template body.
                  category [string, optional] The category of this report template. Can be left blank.
                        Acceptable values are: dataset-viz
                  archived [boolean, optional] Whether the template has been archived.
                  provide api key [boolean, optional] Whether reports based on this template request
                        an API Key from the report viewer.
            Returns
                  id [integer]
                  name [string] The name of the template.
                  category [string] The category of this report template. Can be left blank. Acceptable
                        values are: dataset-viz
                  created at [string/time]
                  updated_at [string/time]
                  use_count [integer] The number of uses of this template.
                  archived [boolean] Whether the template has been archived.
                  author [dict::]
                            • id [integer] The ID of this user.
                            • name [string] This user's name.
                            • username [string] This user's username.
                            • initials [string] This user's initials.
                            • online [boolean] Whether this user is online.
                  tech reviewed [boolean] Whether this template has been audited by Civis for security
                        vulnerability and correctness.
                  auth code url [string] A URL to the template's stored code body.
                  provide api key [boolean] Whether reports based on this template request an API
                        Key from the report viewer.
                  hidden [boolean] The hidden status of the item.
put_reports_shares_groups (id,
                                                         group_ids,
                                                                                    permission_level,
                                                                     share_email_body='DEFAULT',
                                     send_shared_email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
```

**note** [string] A note describing what this template is used for; custom scripts created

```
send shared email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]

                                      - name: string
                  total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total group shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
put_scripts (id, name, *, note='DEFAULT', ui_report_id='DEFAULT', archived='DEFAULT')
      Replace all attributes of this Script Template
            Parameters
                  id [integer]
                  name [string] The name of the template.
                  note [string, optional] A note describing what this template is used for; custom scripts
                        created off this template will display this description.
                  ui report id [integer, optional] The id of the report that this template uses.
                  archived [boolean, optional] Whether the template has been archived.
            Returns
                  id [integer]
                  script id [integer] The id of the script that this template uses.
                  user_context [string] The user context of the script that this template uses.
                  name [string] The name of the template.
                  category [string] The category of this template.
                  note [string] A note describing what this template is used for; custom scripts created
                        off this template will display this description.
                  created_at [string/time]
                  updated_at [string/time]
                  use count [integer] The number of uses of this template.
                  ui_report_id [integer] The id of the report that this template uses.
                  tech_reviewed [boolean] Whether this template has been audited by Civis for security
                        vulnerability and correctness.
                  archived [boolean] Whether the template has been archived.
                  hidden [boolean] The hidden status of the item.
```

```
put_scripts_projects (id, project_id)
      Add a Template::Script to a project
            Parameters
                  id [integer] The ID of the resource.
                  project_id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_scripts_shares_groups (id,
                                                         group_ids,
                                                                                    permission level,
                                                                     share_email_body='DEFAULT',
                                     send_shared_email='DEFAULT')
     Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share email body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer

                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
```

# Users

class Users (session\_kwargs, return\_type='civis')

#### **Methods**

\_\_\_

```
delete api keys (id, key id)
      Revoke the specified API key
            Parameters
                  id [string] The ID of the user or 'me'.
                  key id [integer] The ID of the API key.
            Returns
                  id [integer] The ID of the API key.
                  name [string] The name of the API key.
                  expires_at [string/date-time] The date and time when the key expired.
                  created_at [string/date-time] The date and time when the key was created.
                  revoked_at [string/date-time] The date and time when the key was revoked.
                  last_used_at [string/date-time] The date and time when the key was last used.
                  scopes [list] The scopes which the key is permissioned on.
                  use_count [integer] The number of times the key has been used.
                  expired [boolean] True if the key has expired.
                  active [boolean] True if the key has neither expired nor been revoked.
                  constraints [list::] Constraints on the abilities of the created key - constraint : string
                              The path matcher of the constraint.
                            • constraint_type [string] The type of constraint (exact/prefix/regex/verb).
                            • get allowed [boolean] Whether the constraint allows GET requests.
                            • head allowed [boolean] Whether the constraint allows HEAD requests.
                            • post_allowed [boolean] Whether the constraint allows POST requests.
```

get (id)

Show info about a user

## **Parameters**

id [integer] The ID of this user.

quests.

#### Returns

```
id [integer] The ID of this user.
user [string] The username of this user.
name [string] The name of this user.
email [string] The email of this user.
active [string] The account status of this user.
primary_group_id [integer] The ID of the primary group of this user.
groups [list::] An array of all the groups this user is in. - id: integer
```

The ID of this group.

- name [string] The name of this group.
- organization\_id [integer] The organization associated with this group.

put\_allowed [boolean] Whether the constraint allows PUT requests.
 patch\_allowed [boolean] Whether the constraint allows PATCH requests.
 delete\_allowed [boolean] Whether the constraint allows DELETE re-

city [string] The city of this user.state [string] The state of this user.time zone [string] The time zone of this user.

```
initials [string] The initials of this user.
                  department [string] The department of this user.
                  title [string] The title of this user.
                  github_username [string] The GitHub username of this user.
                  prefers sms otp [string] The preference for phone authorization of this user
                  vpn enabled [string] The availability of vpn for this user.
                  sso disabled [string] The availability of SSO for this user.
                  otp required for login [string] The two factor authorization requirement for this
                        user.
                  phone [string] The phone number of this user.
                  organization_slug [string] The slug of the organization the user belongs to.
                  organization_sso_disable_capable [string] The user's organization's ability to dis-
                        able sso for their users.
                  organization_login_type [string] The user's organization's login type.
get_api_keys (id, key_id)
      Show the specified API key
            Parameters
                  id [string] The ID of the user or 'me'.
                  key id [integer] The ID of the API key.
                  id [integer] The ID of the API key.
                  name [string] The name of the API key.
                  expires at [string/date-time] The date and time when the key expired.
                  created at [string/date-time] The date and time when the key was created.
                  revoked at [string/date-time] The date and time when the key was revoked.
                  last used at [string/date-time] The date and time when the key was last used.
                  scopes [list] The scopes which the key is permissioned on.
                  use_count [integer] The number of times the key has been used.
                  expired [boolean] True if the key has expired.
                  active [boolean] True if the key has neither expired nor been revoked.
                  constraints [list::] Constraints on the abilities of the created key - constraint : string
                              The path matcher of the constraint.
                            • constraint type [string] The type of constraint (exact/prefix/regex/verb).
                            • get allowed [boolean] Whether the constraint allows GET requests.
                            • head allowed [boolean] Whether the constraint allows HEAD requests.
                            • post allowed [boolean] Whether the constraint allows POST requests.
                            • put allowed [boolean] Whether the constraint allows PUT requests.
                            • patch allowed [boolean] Whether the constraint allows PATCH requests.
                            • delete_allowed [boolean] Whether the constraint allows DELETE re-
                                    quests.
get_me_themes (id)
      Show a theme
            Parameters
                  id [integer] The ID of this theme.
            Returns
                  id [integer] The ID of this theme.
                  name [string] The name of this theme.
                  organization ids [list] List of organization ID's allowed to use this theme.
```

```
settings [string] The theme configuration object.
logo_file [dict::]
```

- id [integer] The ID of the logo image file.
- download url [string] The URL of the logo image file.

created at [string/date-time] updated at [string/date-time]

feature flag='DEFAULT', list(\*, account status='DEFAULT', query='DEFAULT', group\_id='DEFAULT', organization\_id='DEFAULT', exclude groups='DEFAULT', limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT') List users

#### **Parameters**

**feature\_flag** [string, optional] Return users that have a feature flag enabled.

account\_status [string, optional] The account status by which to filter users. May be one of "active", "inactive", or "all".

query [string, optional] Return users who match the given query, based on name, user, and email.

group\_id [integer, optional] The ID of the group by which to filter users. Cannot be present if organization id is.

**organization id** [integer, optional] The ID of the organization by which to filter users. Cannot be present if group id is.

exclude\_groups [boolean, optional] Whether or to exclude users' groups. Default:

limit [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 10000.

page\_num [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to name. Must be one of: name, user.

order\_dir [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to asc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page num are ignored. Defaults to False.

# Returns

```
id [integer] The ID of this user.
user [string] The username of this user.
```

**name** [string] The name of this user.

email [string] The email of this user.

active [string] The account status of this user.

primary\_group\_id [integer] The ID of the primary group of this user.

groups [list::] An array of all the groups this user is in. - id: integer

The ID of this group.

- name [string] The name of this group.
- organization\_id [integer] The organization associated with this group.

**created at** [string/date-time] The date and time when the user was created.

current sign in at [string/date-time] The date and time when the user's current session began.

\*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', orlist\_api\_keys(id, der\_dir='DEFAULT', iterator='DEFAULT')

Show API keys belonging to the specified user

#### **Parameters**

id [string] The ID of the user or 'me'.

**limit** [integer, optional] Number of results to return. Defaults to its maximum of 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

#### Returns

id [integer] The ID of the API key.

**name** [string] The name of the API key.

expires\_at [string/date-time] The date and time when the key expired.

created\_at [string/date-time] The date and time when the key was created.

**revoked\_at** [string/date-time] The date and time when the key was revoked.

**last\_used\_at** [string/date-time] The date and time when the key was last used.

**scopes** [list] The scopes which the key is permissioned on.

**use\_count** [integer] The number of times the key has been used.

expired [boolean] True if the key has expired.

active [boolean] True if the key has neither expired nor been revoked.

constraint\_count [integer] The number of constraints on the created key

# list\_me()

Show info about the logged-in user

# Returns

id [integer] The ID of this user.

name [string] This user's name.

email [string] This user's email address.

**username** [string] This user's username.

initials [string] This user's initials.

**last\_checked\_announcements** [string/date-time] The date and time at which the user last checked their announcements.

**feature\_flags** [dict] The feature flag settings for this user.

roles [list] The roles this user has, listed by slug.

**preferences** [dict] This user's preferences.

**custom branding** [string] The branding of Platform for this user.

groups [list::] An array of all the groups this user is in. - id: integer

The ID of this group.

- name [string] The name of this group.
- organization\_id [integer] The organization associated with this group.

**organization name** [string] The name of the organization the user belongs to.

**organization\_slug** [string] The slug of the organization the user belongs to.

organization\_default\_theme\_id [integer] The ID of the organizations's default theme.

**created\_at** [string/date-time] The date and time when the user was created.

sign\_in\_count [integer] The number of times the user has signed in.

**assuming role** [boolean] Whether the user is assuming a role or not.

```
list_me_themes()
List themes

Returns

id [integer] The ID of this theme.

name [string] The name of this theme.

created_at [string/date-time]

updated_at [string/date-time]

list_me_ui()

UI configuration for logged-in user

Returns

id [integer] The ID of this user.
```

user\_type [dict::]

vendor [boolean] True if this user is a member of any groups with a vendor ID.

- media [boolean] True if user has access to the Media Optimizer job type.
- main\_app [string] The slug for the main app for an app-only user account.
- app\_count [integer] Number of apps this user has access to.
- reports only [boolean] True if user is a reports-only user.

**navigation\_menus** [dict] Navigation menus visible to this user. **user\_menus** [dict] User profile menu items available to this user.

• **reports\_creator** [boolean] True if this user is allowed to create HTML reports.

## **Parameters**

preferences [dict, optional::]

- app\_index\_order\_field [string] Order field for the apps index pages.
- app\_index\_order\_dir [string] Oder direction for the apps index pages.
- result\_index\_order\_field [string] Order field for the results index page.
- result\_index\_order\_dir [string] Order direction for the results index page.
- result\_index\_type\_filter [string] Type filter for the results index page.
- result\_index\_author\_filter [string] Author filter for the results index page.
- result\_index\_archived\_filter [string] Archived filter for the results index page.
- import\_index\_order\_field [string] Order field for the imports index page.
- import\_index\_order\_dir [string] Order direction for the imports index page.
- import\_index\_type\_filter [string] Type filter for the imports index page.
- **import\_index\_author\_filter** [string] Author filter for the imports index page.

- **import\_index\_dest\_filter** [string] Destination filter for the imports index page.
- **import\_index\_status\_filter** [string] Status filter for the imports index page.
- **import\_index\_archived\_filter** [string] Archived filter for the imports index page.
- **export\_index\_order\_field** [string] Order field for the exports index page.
- **export\_index\_order\_dir** [string] Order direction for the exports index page.
- **export\_index\_type\_filter** [string] Type filter for the exports index page.
- **export\_index\_author\_filter** [string] Author filter for the exports index page.
- export\_index\_status\_filter [string] Status filter for the exports index page.
- model\_index\_order\_field [string] Order field for the models index page.
- model\_index\_order\_dir [string] Order direction for the models index page.
- model\_index\_author\_filter [string] Author filter for the models index page.
- model\_index\_status\_filter [string] Status filter for the models index page.
- model\_index\_archived\_filter [string] Archived filter for the models index page.
- model\_index\_thumbnail\_view [string] Thumbnail view for the models index page.
- script\_index\_order\_field [string] Order field for the scripts index page.
- **script\_index\_order\_dir** [string] Order direction for the scripts index page.
- script\_index\_type\_filter [string] Type filter for the scripts index page.
- script\_index\_author\_filter [string] Author filter for the scripts index page.
- script index status filter [string] Status filter for the scripts index page.
- script\_index\_archived\_filter [string] Archived filter for the scripts index page.
- **project\_index\_order\_field** [string] Order field for the projects index page.
- **project\_index\_order\_dir** [string] Order direction for the projects index page.
- **project\_index\_author\_filter** [string] Author filter for the projects index page.
- **project\_index\_archived\_filter** [string] Archived filter for the projects index page.

- **report\_index\_thumbnail\_view** [string] Thumbnail view for the reports index page.
- project\_detail\_order\_field [string] Order field for projects detail pages.
- **project\_detail\_order\_dir** [string] Order direction for projects detail pages.
- **project\_detail\_author\_filter** [string] Author filter for projects detail pages.
- project\_detail\_type\_filter [string] Type filter for projects detail pages.
- **project\_detail\_archived\_filter** [string] Archived filter for the projects detail pages.
- enhancement\_index\_order\_field [string] Order field for the enhancements index page.
- **enhancement\_index\_order\_dir** [string] Order direction for the enhancements index page.
- enhancement\_index\_author\_filter [string] Author filter for the enhancements index page.
- enhancement\_index\_archived\_filter [string] Archived filter for the enhancements index page.
- preferred\_server\_id [integer] ID of preferred server.
- **civis\_explore\_skip\_intro** [boolean] Whether the user is shown steps for each exploration.
- registration\_index\_order\_field [string] Order field for the registrations index page.
- **registration\_index\_order\_dir** [string] Order direction for the registrations index page.
- registration\_index\_status\_filter [string] Status filter for the registrations index page.
- **upgrade\_requested** [string] Whether a free trial upgrade has been requested.
- welcome\_order\_field [string] Order direction for the welcome page.
- welcome\_order\_dir [string] Order direction for the welcome page.
- welcome author filter [string] Status filter for the welcome page.
- welcome\_status\_filter [string] Status filter for the welcome page.
- welcome\_archived\_filter [string] Status filter for the welcome page.
- data\_pane\_width [string] Width of the data pane when expanded.
- data\_pane\_collapsed [string] Whether the data pane is collapsed.
- notebook\_order\_field [string] Order field for the notebooks page.
- notebook\_order\_dir [string] Order direction for the notebooks page.
- notebook\_author\_filter [string] Author filter for the notebooks page.
- notebook\_archived\_filter [string] Archived filter for the notebooks page.

- **notebook\_status\_filter** [string] Status filter for the notebooks page.
- workflow\_index\_order\_field [string] Order field for the workflows page.
- workflow\_index\_order\_dir [string] Order direction for the workflows page.
- workflow\_index\_author\_filter [string] Author filter for the workflows page.
- service order field [string] Order field for the services page.
- service\_order\_dir [string] Order direction for the services page.
- service\_author\_filter [string] Author filter for the services page.
- service\_archived\_filter [string] Archived filter for the services page.

last\_checked\_announcements [string/date-time, optional] The date and time at which the user last checked their announcements.

#### **Returns**

id [integer] The ID of this user.

name [string] This user's name.

email [string] This user's email address.

**username** [string] This user's username.

initials [string] This user's initials.

**last\_checked\_announcements** [string/date-time] The date and time at which the user last checked their announcements.

feature flags [dict] The feature flag settings for this user.

**roles** [list] The roles this user has, listed by slug.

**preferences** [dict] This user's preferences.

custom\_branding [string] The branding of Platform for this user.

groups [list::] An array of all the groups this user is in. - id : integer

The ID of this group.

- name [string] The name of this group.
- organization\_id [integer] The organization associated with this group.

**organization\_name** [string] The name of the organization the user belongs to.

**organization\_slug** [string] The slug of the organization the user belongs to.

organization\_default\_theme\_id [integer] The ID of the organizations's default theme.

**created at** [string/date-time] The date and time when the user was created.

sign\_in\_count [integer] The number of times the user has signed in.

**assuming role** [boolean] Whether the user is assuming a role or not.

post\_api\_keys (id, expires\_in, name, \*, constraints='DEFAULT')

Create a new API key belonging to the logged-in user

## **Parameters**

id [string] The ID of the user or 'me'.

**expires\_in** [integer] The number of seconds the key should last for.

**name** [string] The name of the API key.

The path matcher of the constraint.

• **constraint type** [string] The type of constraint (exact/prefix/regex/verb).

- get\_allowed [boolean] Whether the constraint allows GET requests.
- head\_allowed [boolean] Whether the constraint allows HEAD requests.
- post\_allowed [boolean] Whether the constraint allows POST requests.
- put\_allowed [boolean] Whether the constraint allows PUT requests.
- patch\_allowed [boolean] Whether the constraint allows PATCH requests.
- delete\_allowed [boolean] Whether the constraint allows DELETE requests.

## **Returns**

**id** [integer] The ID of the API key.

**name** [string] The name of the API key.

expires\_at [string/date-time] The date and time when the key expired.

**created\_at** [string/date-time] The date and time when the key was created.

revoked\_at [string/date-time] The date and time when the key was revoked.

last\_used\_at [string/date-time] The date and time when the key was last used.

**scopes** [list] The scopes which the key is permissioned on.

**use\_count** [integer] The number of times the key has been used.

**expired** [boolean] True if the key has expired.

active [boolean] True if the key has neither expired nor been revoked.

constraints [list::] Constraints on the abilities of the created key - constraint : string

The path matcher of the constraint.

- **constraint\_type** [string] The type of constraint (exact/prefix/regex/verb).
- get\_allowed [boolean] Whether the constraint allows GET requests.
- head\_allowed [boolean] Whether the constraint allows HEAD requests.
- **post\_allowed** [boolean] Whether the constraint allows POST requests.
- put\_allowed [boolean] Whether the constraint allows PUT requests.
- patch\_allowed [boolean] Whether the constraint allows PATCH requests.
- **delete\_allowed** [boolean] Whether the constraint allows DELETE requests.

token [string] The API key.

## Workflows

class Workflows (session\_kwargs, return\_type='civis')

## **Methods**

delete\_projects (id, project\_id)

Remove a Workflow::Workflow from a project

**Parameters** 

id [integer] The ID of the resource.

project\_id [integer] The ID of the project.

Returns

None Response code 204: success

## delete\_shares\_groups (id, group\_id)

Revoke the permissions a group has on this object

#### **Parameters**

 $id \;\; [integer]$  The ID of the resource that is shared.

**group\_id** [integer] The ID of the group.

#### Returns

None Response code 204: success

#### delete shares users (id, user id)

Revoke the permissions a user has on this object

## **Parameters**

id [integer] The ID of the resource that is shared.

**user\_id** [integer] The ID of the user.

#### Returns

None Response code 204: success

## get (id)

Get a Workflow

#### **Parameters**

id [integer]

#### Returns

id [integer] The ID for this workflow.

**name** [string] The name of this workflow.

description [string] A description of the workflow.

**definition** [string] The definition of the workflow in YAML format. Must not be specified if *fromJobChain* is specified.

valid [boolean] The validity of the workflow definition.

validation\_errors [string] The errors encountered when validating the workflow definition.

**file\_id** [string] The file id for the s3 file containing the workflow configuration. **user** [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**state** [string] The state of the workflow. State is "running" if any execution is running, otherwise reflects most recent execution state.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

time\_zone [string] The time zone of this workflow.

**next\_execution\_at** [string/time] The time of the next scheduled execution.

notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- success\_on [boolean] If success email notifications are on
- failure\_on [boolean] If failure email notifications are on

**archived** [string] The archival status of the requested item(s).

**hidden** [boolean] The hidden status of the item.

created\_at [string/time]

updated\_at [string/time]

## get\_executions (id, execution\_id)

Get a workflow execution

#### **Parameters**

id [integer] The ID for the workflow.

execution\_id [integer] The ID for the workflow execution.

## Returns

id [integer] The ID for this workflow execution.

**state** [string] The state of this workflow execution.

**mistral\_state** [string] The state of this workflow as reported by mistral. One of running, paused, success, error, or cancelled

mistral\_state\_info [string] The state info of this workflow as reported by mistral. user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**definition** [string] The definition of the workflow for this execution.

**input** [dict] Key-value pairs defined for this execution.

included\_tasks [list] The subset of workflow tasks selected to execute.

tasks [list::] The tasks associated with this execution. - name : string

The name of the task.

- mistral\_state [string] The state of this task. One of idle, waiting, running, delayed, success, or error
- mistral\_state\_info [string] Extra info associated with the state of the task.
- runs [list::] The runs associated with this task, in descending order by id.
   id: integer

The ID of the run.

- job id [integer] The ID of the job associated with the run.

• **executions** [list::] The executions run by this task, in descending order by id. - id: integer

The ID of the execution.

 workflow\_id [integer] The ID of the workflow associated with the execution.

**started at** [string/time] The time this execution started.

**finished at** [string/time] The time this execution finished.

created\_at [string/time] The time this execution was created.

**updated\_at** [string/time] The time this execution was last updated.

## get\_git\_commits (id, commit\_hash)

Get file contents at commit hash

## **Parameters**

id [integer] The ID of the file.

commit\_hash [string] The SHA (full or shortened) of the desired git commit.

#### **Returns**

**content** [string] The file's contents.

type [string] The file's type.

size [integer] The file's size.

file hash [string] The SHA of the file.

list (\*, hidden='DEFAULT', archived='DEFAULT', author='DEFAULT', limit='DEFAULT',
 page\_num='DEFAULT', order='DEFAULT', order\_dir='DEFAULT', iterator='DEFAULT')
 List Workflows

#### **Parameters**

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

**archived** [string, optional] The archival status of the requested item(s).

**author** [string, optional] If specified, return workflows from this author. It accepts a comma- separated list of author ids.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to updated\_at. Must be one of: updated\_at, name, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## **Returns**

**id** [integer] The ID for this workflow.

name [string] The name of this workflow.

description [string] A description of the workflow.

valid [boolean] The validity of the workflow definition.

**file\_id** [string] The file id for the s3 file containing the workflow configuration. **user** [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.

- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The state of the workflow. State is "running" if any execution is running, otherwise reflects most recent execution state.

schedule [dict::]

- **scheduled** [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

time\_zone [string] The time zone of this workflow.

**next\_execution\_at** [string/time] The time of the next scheduled execution.

**archived** [string] The archival status of the requested item(s).

created\_at [string/time]

updated at [string/time]

list\_executions(id, \*, limit='DEFAULT', page\_num='DEFAULT', order='DEFAULT', order='DEFAULT', iterator='DEFAULT')

List workflow executions

#### **Parameters**

id [integer] The ID for this workflow.

**limit** [integer, optional] Number of results to return. Defaults to 20. Maximum allowed is 50.

**page\_num** [integer, optional] Page number of the results to return. Defaults to the first page, 1.

**order** [string, optional] The field on which to order the result set. Defaults to id. Must be one of: id, updated\_at, created\_at.

**order\_dir** [string, optional] Direction in which to sort, either asc (ascending) or desc (descending) defaulting to desc.

**iterator** [bool, optional] If True, return a generator to iterate over all responses. Use when more results than the maximum allowed by limit are needed. When True, limit and page\_num are ignored. Defaults to False.

## Returns

id [integer] The ID for this workflow execution.

**state** [string] The state of this workflow execution.

**mistral\_state** [string] The state of this workflow as reported by mistral. One of running, paused, success, error, or cancelled

mistral\_state\_info [string] The state info of this workflow as reported by mistral. user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**started\_at** [string/time] The time this execution started.

**finished\_at** [string/time] The time this execution finished.

created\_at [string/time] The time this execution was created.

```
updated_at [string/time] The time this execution was last updated.
```

## list\_git (id)

Get the git metadata attached to this Workflow::Workflow

## **Parameters**

id [integer] The ID of the file.

## Returns

**git\_ref** [string] A git reference specifying an unambiguous version of the file. Can be a branch name, or the full or shortened SHA of a commit.

git\_branch [string] The git branch that the file is on.

git\_path [string] The path of the file in the repository.

git\_repo [dict::]

- id [integer] The ID for this git repository.
- repo\_url [string] The URL for this git repository.
- created\_at : string/time
- updated\_at : string/time

## list\_git\_commits(id)

Get the git commits for this Workflow::Workflow

#### **Parameters**

id [integer] The ID of the file.

#### Returns

commit\_hash [string] The SHA of the commit.

author\_name [string] The name of the commit's author.

date [string/time] The commit's timestamp.

message [string] The commit message.

## list\_projects (id, \*, hidden='DEFAULT')

List the projects a Workflow::Workflow belongs to

#### **Parameters**

id [integer] The ID of the resource.

**hidden** [boolean, optional] If specified to be true, returns hidden items. Defaults to false, returning non-hidden items.

## Returns

id [integer] The ID for this project.

author [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**name** [string] The name of this project.

**description** [string] A description of the project.

users [list::] Users who can see the project. - id: integer

The ID of this user.

- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.

```
• online [boolean] Whether this user is online.
                  auto_share [boolean]
                  created at [string/time]
                  updated_at [string/time]
                  archived [string] The archival status of the requested item(s).
list shares (id)
     List users and groups permissioned on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  total user shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
                  name='DEFAULT', description='DEFAULT', definition='DEFAULT', sched-
patch (id,
        ule='DEFAULT', time_zone='DEFAULT', notifications='DEFAULT')
      Update some attributes of this Workflow
            Parameters
                  id [integer] The ID for this workflow.
                  name [string, optional] The name of this workflow.
                  description [string, optional] A description of the workflow.
                  definition [string, optional] The definition of the workflow in YAML format. Must
                        not be specified if from Job Chain is specified.
```

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**time\_zone** [string, optional] The time zone of this workflow. **notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- success on [boolean] If success email notifications are on
- failure\_on [boolean] If failure email notifications are on

#### Returns

id [integer] The ID for this workflow.

name [string] The name of this workflow.

description [string] A description of the workflow.

**definition** [string] The definition of the workflow in YAML format. Must not be specified if *fromJobChain* is specified.

valid [boolean] The validity of the workflow definition.

validation\_errors [string] The errors encountered when validating the workflow definition

**file\_id** [string] The file id for the s3 file containing the workflow configuration. **user** [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The state of the workflow. State is "running" if any execution is running, otherwise reflects most recent execution state.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.

- **scheduled\_minutes** [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**time\_zone** [string] The time zone of this workflow.

next\_execution\_at [string/time] The time of the next scheduled execution.
notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- success\_on [boolean] If success email notifications are on
- failure on [boolean] If failure email notifications are on

**archived** [string] The archival status of the requested item(s).

**hidden** [boolean] The hidden status of the item.

created\_at [string/time]

updated\_at [string/time]

post (name, \*, description='DEFAULT', from\_job\_chain='DEFAULT', definition='DEFAULT', schedule='DEFAULT', time\_zone='DEFAULT', notifications='DEFAULT', hidden='DEFAULT') Create a Workflow

## **Parameters**

name [string] The name of this workflow.

description [string, optional] A description of the workflow.

**from\_job\_chain** [integer, optional] If specified, create a workflow from the job chain this job is in, and inherit the schedule from the root of the chain.

**definition** [string, optional] The definition of the workflow in YAML format. Must not be specified if *fromJobChain* is specified.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**time\_zone** [string, optional] The time zone of this workflow. **notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success email subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.

- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- success\_on [boolean] If success email notifications are on
- failure on [boolean] If failure email notifications are on

**hidden** [boolean, optional] The hidden status of the item.

## Returns

id [integer] The ID for this workflow.

**name** [string] The name of this workflow.

description [string] A description of the workflow.

**definition** [string] The definition of the workflow in YAML format. Must not be specified if *fromJobChain* is specified.

valid [boolean] The validity of the workflow definition.

validation\_errors [string] The errors encountered when validating the workflow definition.

**file\_id** [string] The file id for the s3 file containing the workflow configuration. **user** [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The state of the workflow. State is "running" if any execution is running, otherwise reflects most recent execution state.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**time zone** [string] The time zone of this workflow.

next\_execution\_at [string/time] The time of the next scheduled execution.
notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the iob fails.

- success on [boolean] If success email notifications are on
- failure on [boolean] If failure email notifications are on

**archived** [string] The archival status of the requested item(s).

**hidden** [boolean] The hidden status of the item.

created\_at [string/time]

updated at [string/time]

post\_clone (id, \*, clone\_schedule='DEFAULT', clone\_notifications='DEFAULT')
Clone this Workflow

## **Parameters**

id [integer] The ID for the workflow.

clone\_schedule [boolean, optional] If true, also copy the schedule to the new workflow.

clone\_notifications [boolean, optional] If true, also copy the notifications to the new workflow.

## **Returns**

id [integer] The ID for this workflow.

**name** [string] The name of this workflow.

description [string] A description of the workflow.

**definition** [string] The definition of the workflow in YAML format. Must not be specified if *fromJobChain* is specified.

valid [boolean] The validity of the workflow definition.

validation\_errors [string] The errors encountered when validating the workflow definition

**file\_id** [string] The file id for the s3 file containing the workflow configuration. **user** [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The state of the workflow. State is "running" if any execution is running, otherwise reflects most recent execution state.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**time zone** [string] The time zone of this workflow.

next\_execution\_at [string/time] The time of the next scheduled execution.
notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.

- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- success on [boolean] If success email notifications are on
- failure\_on [boolean] If failure email notifications are on

**archived** [string] The archival status of the requested item(s).

hidden [boolean] The hidden status of the item.

created at [string/time]

updated\_at [string/time]

Execute a workflow

## **Parameters**

id [integer] The ID for the workflow.

target\_task [string, optional] For a reverse workflow, the name of the task to target.

input [dict, optional] Key-value pairs to send to this execution as inputs.

included\_tasks [list, optional] If specified, executes only the subset of workflow tasks included.

## Returns

id [integer] The ID for this workflow execution.

**state** [string] The state of this workflow execution.

**mistral\_state** [string] The state of this workflow as reported by mistral. One of running, paused, success, error, or cancelled

mistral\_state\_info [string] The state info of this workflow as reported by mistral. user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**definition** [string] The definition of the workflow for this execution.

**input** [dict] Key-value pairs defined for this execution.

included tasks [list] The subset of workflow tasks selected to execute.

tasks [list::] The tasks associated with this execution. - name : string

The name of the task.

- mistral\_state [string] The state of this task. One of idle, waiting, running, delayed, success, or error
- mistral\_state\_info [string] Extra info associated with the state of the task.
- runs [list::] The runs associated with this task, in descending order by id.
   id: integer

The ID of the run.

- job\_id [integer] The ID of the job associated with the run.
- executions [list::] The executions run by this task, in descending order by id. id: integer

The ID of the execution.

 workflow\_id [integer] The ID of the workflow associated with the execution.

started\_at [string/time] The time this execution started.finished\_at [string/time] The time this execution finished.created\_at [string/time] The time this execution was created.updated at [string/time] The time this execution was last updated.

## post\_executions\_cancel (id, execution\_id)

Cancel a workflow execution

## **Parameters**

id [integer] The ID for the workflow.

execution\_id [integer] The ID for the workflow execution.

#### Returns

id [integer] The ID for this workflow execution.

state [string] The state of this workflow execution.

**mistral\_state** [string] The state of this workflow as reported by mistral. One of running, paused, success, error, or cancelled

mistral\_state\_info [string] The state info of this workflow as reported by mistral. user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**definition** [string] The definition of the workflow for this execution.

**input** [dict] Key-value pairs defined for this execution.

included\_tasks [list] The subset of workflow tasks selected to execute.

tasks [list::] The tasks associated with this execution. - name : string

The name of the task.

- mistral\_state [string] The state of this task. One of idle, waiting, running, delayed, success, or error
- mistral\_state\_info [string] Extra info associated with the state of the
- runs [list::] The runs associated with this task, in descending order by id.
   id: integer

The ID of the run.

- job\_id [integer] The ID of the job associated with the run.
- **executions** [list::] The executions run by this task, in descending order by id. id: integer

The ID of the execution.

 workflow\_id [integer] The ID of the workflow associated with the execution.

**started\_at** [string/time] The time this execution started.

**finished at** [string/time] The time this execution finished.

created\_at [string/time] The time this execution was created.

**updated at** [string/time] The time this execution was last updated.

## post\_executions\_resume (id, execution\_id)

Resume a paused workflow execution

## **Parameters**

id [integer] The ID for the workflow.

execution\_id [integer] The ID for the workflow execution.

## **Returns**

id [integer] The ID for this workflow execution.

state [string] The state of this workflow execution.

**mistral\_state** [string] The state of this workflow as reported by mistral. One of running, paused, success, error, or cancelled

mistral\_state\_info [string] The state info of this workflow as reported by mistral. user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- **username** [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**definition** [string] The definition of the workflow for this execution.

input [dict] Key-value pairs defined for this execution.

included tasks [list] The subset of workflow tasks selected to execute.

tasks [list::] The tasks associated with this execution. - name : string

The name of the task.

- mistral\_state [string] The state of this task. One of idle, waiting, running, delayed, success, or error
- mistral\_state\_info [string] Extra info associated with the state of the task.
- runs [list::] The runs associated with this task, in descending order by id.
   id: integer

The ID of the run.

- **job\_id** [integer] The ID of the job associated with the run.
- executions [list::] The executions run by this task, in descending order by id. id: integer

The ID of the execution.

 workflow\_id [integer] The ID of the workflow associated with the execution.

```
started_at [string/time] The time this execution started.
finished_at [string/time] The time this execution finished.
created_at [string/time] The time this execution was created.
updated at [string/time] The time this execution was last updated.
```

post\_executions\_retry (id, execution\_id, \*, task\_name='DEFAULT')

Retry a failed task, or all failed tasks in an execution

#### **Parameters**

id [integer] The ID for the workflow.

execution\_id [integer] The ID for the workflow execution.

**task\_name** [string, optional] If specified, the name of the task to be retried. If not specified, all failed tasks in the execution will be retried.

## **Returns**

id [integer] The ID for this workflow execution.

**state** [string] The state of this workflow execution.

**mistral\_state** [string] The state of this workflow as reported by mistral. One of running, paused, success, error, or cancelled

mistral\_state\_info [string] The state info of this workflow as reported by mistral. user [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- **online** [boolean] Whether this user is online.

**definition** [string] The definition of the workflow for this execution.

input [dict] Key-value pairs defined for this execution.

included\_tasks [list] The subset of workflow tasks selected to execute.

tasks [list::] The tasks associated with this execution. - name : string

The name of the task.

- mistral\_state [string] The state of this task. One of idle, waiting, running, delayed, success, or error
- mistral\_state\_info [string] Extra info associated with the state of the task.
- runs [list::] The runs associated with this task, in descending order by id.
   id: integer

The ID of the run.

- job\_id [integer] The ID of the job associated with the run.
- executions [list::] The executions run by this task, in descending order by id. id : integer

The ID of the execution.

 workflow\_id [integer] The ID of the workflow associated with the execution.

started\_at [string/time] The time this execution started.
finished\_at [string/time] The time this execution finished.
created at [string/time] The time this execution was created.

**updated\_at** [string/time] The time this execution was last updated.

post\_git\_commits (id, content, message, file\_hash)

Commit and push a new version of the file

## **Parameters**

id [integer] The ID of the file.

**content** [string] The contents to commit to the file.

message [string] A commit message describing the changes being made.

**file\_hash** [string] The full SHA of the file being replaced.

## Returns

**content** [string] The file's contents.

**type** [string] The file's type.

**size** [integer] The file's size.

file\_hash [string] The SHA of the file.

## **Parameters**

id [integer] The ID for this workflow.

**name** [string] The name of this workflow.

**description** [string, optional] A description of the workflow.

**definition** [string, optional] The definition of the workflow in YAML format. Must not be specified if *fromJobChain* is specified.

schedule [dict, optional::]

- scheduled [boolean] If the item is scheduled.
- **scheduled\_days** [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**time\_zone** [string, optional] The time zone of this workflow. **notifications** [dict, optional::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- success\_email\_body [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- success\_on [boolean] If success email notifications are on
- failure\_on [boolean] If failure email notifications are on

## **Returns**

id [integer] The ID for this workflow.

name [string] The name of this workflow.

**description** [string] A description of the workflow.

**definition** [string] The definition of the workflow in YAML format. Must not be specified if *fromJobChain* is specified.

valid [boolean] The validity of the workflow definition.

**validation\_errors** [string] The errors encountered when validating the workflow definition.

**file\_id** [string] The file id for the s3 file containing the workflow configuration. **user** [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The state of the workflow. State is "running" if any execution is running, otherwise reflects most recent execution state.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled\_hours [list] Hours of the day it is scheduled on.
- scheduled minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

time\_zone [string] The time zone of this workflow.

next\_execution\_at [string/time] The time of the next scheduled execution.
notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- **failure\_email\_addresses** [list] Addresses to notify by e-mail when the job fails.
- success\_on [boolean] If success email notifications are on
- failure\_on [boolean] If failure email notifications are on

archived [string] The archival status of the requested item(s).

hidden [boolean] The hidden status of the item.

created\_at [string/time]

updated\_at [string/time]

put\_archive (id, status)

Update the archive status of this object

## **Parameters**

id [integer] The ID of the object.

status [boolean] The desired archived status of the object.

Returns

**id** [integer] The ID for this workflow.

**name** [string] The name of this workflow.

**description** [string] A description of the workflow.

**definition** [string] The definition of the workflow in YAML format. Must not be specified if *fromJobChain* is specified.

valid [boolean] The validity of the workflow definition.

validation\_errors [string] The errors encountered when validating the workflow definition.

**file\_id** [string] The file id for the s3 file containing the workflow configuration. **user** [dict::]

- id [integer] The ID of this user.
- name [string] This user's name.
- username [string] This user's username.
- initials [string] This user's initials.
- online [boolean] Whether this user is online.

**state** [string] The state of the workflow. State is "running" if any execution is running, otherwise reflects most recent execution state.

schedule [dict::]

- scheduled [boolean] If the item is scheduled.
- scheduled\_days [list] Day based on numeric value starting at 0 for Sunday.
- scheduled hours [list] Hours of the day it is scheduled on.
- scheduled\_minutes [list] Minutes of the day it is scheduled on.
- **scheduled\_runs\_per\_hour** [integer] Alternative to scheduled minutes, number of times to run per hour.

**time\_zone** [string] The time zone of this workflow.

next\_execution\_at [string/time] The time of the next scheduled execution.
notifications [dict::]

- urls [list] URLs to receive a POST request at job completion
- success\_email\_subject [string] Custom subject line for success e-mail.
- **success\_email\_body** [string] Custom body text for success e-mail, written in Markdown.
- **success\_email\_addresses** [list] Addresses to notify by e-mail when the job completes successfully.
- failure\_email\_addresses [list] Addresses to notify by e-mail when the job fails.
- success\_on [boolean] If success email notifications are on
- failure\_on [boolean] If failure email notifications are on

**archived** [string] The archival status of the requested item(s).

**hidden** [boolean] The hidden status of the item.

created\_at [string/time]

updated\_at [string/time]

Attach this Workflow::Workflow to a git repo/file

```
Parameters
                  id [integer] The ID of the file.
                  git ref [string, optional] A git reference specifying an unambiguous version of the
                        file. Can be a branch name, or the full or shortened SHA of a commit.
                  git branch [string, optional] The git branch that the file is on.
                  git path [string, optional] The path of the file in the repository.
                  git repo url [string, optional] The URL of the git repository.
            Returns
                  git ref [string] A git reference specifying an unambiguous version of the file. Can be
                        a branch name, or the full or shortened SHA of a commit.
                  git_branch [string] The git branch that the file is on.
                  git_path [string] The path of the file in the repository.
                  git_repo [dict::]
                            • id [integer] The ID for this git repository.
                            • repo_url [string] The URL for this git repository.
                            • created_at : string/time
                            • updated at : string/time
put_projects (id, project_id)
      Add a Workflow::Workflow to a project
            Parameters
                  id [integer] The ID of the resource.
                  project id [integer] The ID of the project.
            Returns
                  None Response code 204: success
put_shares_groups (id,
                               group_ids, permission_level,
                                                                *, share_email_body='DEFAULT',
                          send_shared_email='DEFAULT')
      Set the permissions groups has on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  group_ids [list] An array of one or more group IDs.
                  permission_level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send_shared_email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name : string
                            • groups [list::]
                                      - id: integer
                                      - name: string
                  writers [dict::]
                            • users [list::]
                                      - id: integer
                                      - name: string
                            • groups [list::]
```

```
- id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  total_user_shares [integer] For owners, the number of total users shared. For writers
                        and readers, the number of visible users shared.
                  total_group_shares [integer] For owners, the number of total groups shared. For writ-
                        ers and readers, the number of visible groups shared.
                                                                      share email body='DEFAULT',
put_shares_users (id,
                              user_ids, permission_level,
                        send shared email='DEFAULT')
      Set the permissions users have on this object
            Parameters
                  id [integer] The ID of the resource that is shared.
                  user_ids [list] An array of one or more user IDs.
                  permission level [string] Options are: "read", "write", or "manage".
                  share_email_body [string, optional] Custom body text for e-mail sent on a share.
                  send shared email [boolean, optional] Send email to the recipients of a share.
            Returns
                  readers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  writers [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
                                     - id: integer
                                     - name: string
                  owners [dict::]
                            • users [list::]
                                     - id: integer
                                     - name: string
                            • groups [list::]
```

```
- id: integer
```

- name: string

**total\_user\_shares** [integer] For owners, the number of total users shared. For writers and readers, the number of visible users shared.

**total\_group\_shares** [integer] For owners, the number of total groups shared. For writers and readers, the number of visible groups shared.

## 6.6 Command Line Interface

A command line interface (CLI) to Civis is provided. This can be invoked by typing the command civis in the shell (sh, bash, zsh, etc.). It can also be used in Civis container scripts where the Docker image has this client installed. Here's a simple example of printing the types of scripts.

```
> civis scripts list-types
- name: sql
- name: python3
- name: javascript
- name: r
- name: containers
```

Not all API endpoints are available through the CLI since some take complex data types (e.g., arrays, objects/dictionaries) as input. However, functionality is available for getting information about scripts, logs, etc., as well as executing already created scripts.

There are a few extra, CLI-only commands that wrap the Files API endpoints to make uploading and downloading files easier: civis files upload \$PATH and civis files download \$FILEID \$PATH.

The default output format is YAML, but the --json-output allows you to get output in JSON.

## 6.6.1 Notebooks

The following CLI-only commands make it easier to use Civis Platform as a backend for your Jupyter notebooks.

• civis notebooks download \$NOTEBOOK\_ID \$PATH

Download a notebook from Civis Platform to the requested file on the local filesystem.

civis notebooks new [\$LANGUAGE] [--mem \$MEMORY] [--cpu \$CPU]

Create a new notebook, allocate resources for it, and open it in a tab of your default web browser. This command is the most similar to <code>jupyter notebook</code>. By default, Civis Platform will create a Python 3 notebook, but you can request any other language. Optional resource parameters let you allocate more memory or CPU to your notebook.

civis notebooks up \$NOTEBOOK\_ID [--mem \$MEMORY] [--cpu \$CPU]

Allocate resources for a notebook which already exists in Civis Platform and open it in a tab of your default browser. Optional resource arguments allow you to change resources allocated to your notebook (default to using the same resources as the previous run).

• civis notebooks down \$NOTEBOOK\_ID

Stop a running notebook and free up the resources allocated to it.

• civis notebooks open \$NOTEBOOK\_ID

Open an existing notebook (which may or may not be running) in your default browser.
